On 12 May 89, the operating system and the hardware were mated. The spacecraft version of the Quadron software (called qCF) has been under development by Harold Price, NK6K and Skip Hansen, WB6YMH, for several months. Jeff Ward, G0/K8KA and other UoSAT engineers have been keeping Quadron up to date on the latest hardware developments, so minimum delay

was expected between the arrival of the hardware and the first successful test.

The UoSAT version of the operating system is very close to the same code as that which runs on the Microsat CPU and on the original qCF host, the IBM Realtime Interface Co-Processor (RIC). The major differences are the timers, the low-level RAMUNIT access, and the low-level I/O drivers. All of the user-level interfaces are the same, allowing the IBM RIC card to be used as an inexpensive software development platform, and allowing for easy exchange of software and ideas between UoSAT and Microsat.

The multitasking operating system and the non-file parts of the C library were brought up on the PCE today. The AX25 driver awaits the PCE-specific HDLC drivers, which should be available shortly. The AX25 driver has already been tested on Microsat and the RIC.

Please use Bulletin ID UOSAT.261A if put on a packet radio BBS.

1131. More Chinese jamming of V.O.A. and V.O.A. schedules

Newsgroup: rec.ham-radio
Date: 1989-06-04 15:58:38 UTC
From: dong@brauer.harvard.edu
Message-ID: <2000@husc6.harvard.edu>
Source record: 18508

I have posted this before, but for some unknown reason the news
posting program got skewed up. I am trying to repost it agin and hope it is
going to be OK this time.

Last night in World of Radio on WRNO 13720 Khz at 23:00 UTC, the
host Glenn Hauser gave some details about the Chinese jamming of the V.O.A.
Chinese program.

According the Voice magazine [the program guide published by the
V.O.A.], V.O.A. Chinese service is on
5955 7285 9660 11965 15410 at 11:00 - 15:30 UTC
6130 7200 9545 11925 at 22:00 - 02:00 UTC.
The new 1 mega watt medium wave frequency is 1142 khz.

The anchorwoman of CCTV English service Wei Hua [interviewed by Ted
Koppel on ABC Nightline a couple of weeks ago] was told not to be
interviewed again, otherwise she's going to be fired.

In MediaNetwork by Johnathan Marks, the host mentioned that
since yesterday [I assume it was may 30], the Chinese authority had
intensified the jamming of the V.O.A. The Central People's Broadcasting
Station (Zhong Yang Ren Min Guang Bo Dian Tai) [I am not sure it is #1 or
#2] moved to the V.O.A. frequency 15410 khz at 10:00 - 15:00 UTC. [I tried
to monitor the frequency at 13:30 UTC, the V.O.A. Chinese still came in load
and clear in Boston.] the other two previsely unjammed frequencies 17890
and 21585 khz are now being jammed by noise jammers.
Before the end of the show, the host mentioned that a while ago
somebody at the Asian Broadcasting Institute in Tokyo called [I didn't get
the name] in and told him that all V.O.A. Chinese frequencies were now
being heavily jammed.

As always, my personal comments and observations are in [.....].
Any thing else is from sources indicated above.
The mail service here is far away from being reliable. If you have
tried to contact me and didn't get my response, please try again.

Subj: Sudden AO-13 Power Loss

Dumped on 04 Jun 89 12:44:44 Sunday by ELE093

From: JAMES MILLER G3RUH via TMAIL Address: UOSAT
Date: 1989 Jun 04

Mysterious AO-13 Power loss?
by James Miller G3RUH

I was routinely watching (and recording) the AO-13 PSK telemetry on orbit 743 at MA 190 during mode L operation. It was 1989 Jun 03 @ 2200 UTC. Gradually I saw an anomaly; an alarmingly increasing negative power budget. At first the usual minus 100 milliamps asociated with mode L, but quite soon the net battery drain was an unprecedented 1.5 amps. The battery voltage was falling fast. Normal is 14.5 volts. It was now 12.8. The beacon was warbling.
Adrenalin rushed to my head. Something was badly wrong. Options raced through my mind. Was my software wrong? Grabbed another program; same story. Should I turn off the transponder? Should I phone the other command stations?
Then I noticed the solar panel temperatures plunging. Normal is 8 deg C, but now they were down to -10 deg C. The Sun angle was nonsense. And the spin rate counter had stopped. It's driven by the Sun sensor.
No Sun? An eclipse??? Impossible; the Sun's 48 degrees above the orbit plane.
But wait; surely not the Moon blotting out the Sun? Grab astronomical almanac. Partial eclipses in March and August - and this is June. Ah, but Oscar-13 is 30,000 km from the Earth. If it were New Moon time, the Moon's shadow would be fairly close by. Reached for my diary, shaking. Jun 3rd, Saturday. There's the familiar black circle. Relief! New Moon. So AO-13 must be in the shadow of an eclipse of the Sun by the Moon. So it can't last more than a few more minutes. It lasted 20.
The eclipse started around 2200, minimum solar panel output was at 2210, and recharge commenced 2220. The panels warmed up again, the spin rate counter recovered, and the Sun angle went back to -11 degrees.
Now to prove it. Long past bedtime, but I couldn't sleep. I would need the Sun, Moon and Satellite's position in celestial coordinates. My program PLAN-13 already computes them for the Sun and satellite, so I punched them out. The Astronomical almanac gave them for the Moon.

dec ra Distance km

SUN 22.39589 71.88333 1.51767*10^8) Position at
MOON 27.34831 72.61417 369228) 1989 Jun 03
SAT 42.73401 241.87217 34451) 2210 UTC

Next I wrote a 15 line program to manipulate these numbers. First I converted them into rectangular X,Y,Z cordinates, and normalised them all to the Sun's distance. Then I calculated the shadow vector relative to the Moon, M-S, and the Satellite position relative to the Moon, R-S. Bingo! Almost identical. See below. Take their dot product, then ARCCOS and the angle between shadow and satellite is 7.9 minutes of arc. Since the Moon's diameter was 32 minutes of arc seen from AO-13, the satellite was in its shadow. The Moon really was eclipsing the Sun!

Object X Y Z

Sun 0.287499 0.878738 0.381004)
Moon 0.000646 0.002062 0.001118) Unit = 1 Sun-Earth dist
Rsat -0.000079 -0.000147 0.000154)

M-S -0.287550 -0.878806 -0.380809 (Normalised)
R-M -0.287795 -0.877825 -0.382880 (Normalised)

Geocentric rectangular coordinates.

I rather suspect that Moon eclipses are more common that we might suppose. Would someone like to get their number crunchers out, and work out the next ones? PLEASE.

P.S. You may already have the sub-routines needed, but if not I commend you to the superb "Astronomy With Your Personal Computer", Peter Duffet-Smith, Cambridge 1986, ISBN 0-521-31976-5. An IBM disc with the programs is available from the publisher, as specified in the book.

Best wishes - James G3RUH, Cambridge, England.

AMSAT-UK/RSGB DATASPACE '89

HR AMSAT NEWS SERVICE BULLETIN 154.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 3, 1989
TO ALL RADIO AMATEURS BT

AMSAT-UK And RSGB Join Together To Sponsor "DATASPACE '89"

AMSAT-UK and the Radio Society of Great Britian (RSGB) will combine their efforts this year to sponsor a joint symposium dealing with OSCAR satellites, digital communications, and educational uses of amateur radio satellites.

Because of the combined theme of "data communications" and amateur satellites, the name of this year's AMSAT-UK/RSGB Data Symposiums will be appropriately known as "DATASPACE '89." With the launch of the MICROSATs and UOSAT D & E later this year, OSCAR enthusiasts should find this combination particularly interesting. As in years past, the University of Surrey will be the meeting place for this combined colloquia. The following is the "line-up" of programs planned for the weekend of July 27-31:

Thursday, June 27th: International Space Assembly
Friday, June 28th: RSGB Data Symposium
Saturday June 29th: Combined Dataspace Tryst
Sunday June 30th: AMSAT-UK Space Colloquium
Monday June 31st: Satellites-in-Education Colloquium

If you are interested in finding out more details concerning accommodations and the programs to be presented, contact:

Ron Broadbent, G3AAJ
94 Herongate Road
Wanstead Park
London E12 5EQ England

Tel: 01-989-6741

PHASE IV MODEL "ROLLED-OUT"

HR AMSAT NEWS SERVICE BULLETIN 154.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 3, 1989
TO ALL RADIO AMATEURS BT

Full-Scale Model Of AMSAT-NA Phase IV Geostationary Satellite Completed

On May 24,1989 a "full-scale" model of the AMSAT-NA Geostationary satellite concept was rolled-out for presentation and a photo session at Weber State College (WSC) in Ogden, Utah. Many AMSAT-NA members will remember that the AMSAT-NA Board of Directors voted to accept a "statement-of-work" presented by WSC last November to build this "mock-up" of the Phase IV satellite as part of a "senior" engineering project for students enrolled in the WSC Center for Aerospace Technology (CAST). Present for the "roll-out" was AMSAT-NA's Chief Engineer, Dick Jansson (WD4FAB). Upon seeing the completed model for the first time, Dick pointed out that the size of this Phase IV spacecraft is "awesome." He mentioned that this twelve-sided, 30 inch high, 8 foot diameter model is so large, he saw one student crawl inside and disappear; Dick added: "This has to be the largest satellite AMSAT has ever designed." After the photo session, the Phase IV model was put into a special crate and will be trucked to Dallas for the HAMCOM/ARRL National Convention in Arlington, TX. It will be displayed in the main lobby of the HAMCOM convention center in keeping with the ARRL's slogan, "FROM SPARK ...1914-1989...TO SPACE."

After HAMCOM, the Phase IV model will be returned to WSC where it will be used as a "test-bed" for future design work on the Phase IV concept. WD4FAB

commented that the work put forth by the "highly dedicated" CAST students on this "high fidelity" model was "superb." It is estimated that over 10,000 hours of donated student labor went into building this model. AMSAT-NA was would like to express its appreciation to Bill Clapp, Director of the CAST, and, to the students of WSC for this excellent "prototype" model.

ZRO TESTS SCHEDULE ANNOUNCED

HR AMSAT NEWS SERVICE BULLETIN 154.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 3, 1989
TO ALL RADIO AMATEURS BT

The Popular "ZRO Tests" Are Scheduled To Begin Again In July

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" will be reactivated in July following the mid-June reorientation of AMSAT-OSCAR-13 (AO-13). This activity is a test to evaluate the operating skill and equipment performance. During a typical ZRO run, a control station will send numeric code groups using CW at 10 WPM. At the beginning of the ZRO Test run, the uplink power from the control station is set to match the general beacon downlink strength. This is level "zero". The control operator will then send and repeat a random five-digit number; next, he will lower his uplink power by 3 dB (half power) and repeat the procedure with a new random number. This will continue to a level 27 dB below the beacon (level "nine"). A participating listener then monitors the downlink signals until he can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve your home-station performance to a point where the lower-level downlink signals can be copied (levels 6 through 9). The best reported achievement since the inception of the program several years ago via AO-10 came from W7ID. Recently, W7ID copied four out of five digits correctly at level 9 on a run via AO-13 earlier this year. The estimated EIRP from the control station, WA5ZIB, was just over ONE Watt!

The following schedule of Mode "B" ZRO tests with a downlink frequency of 145.840 MHz was chosen for convenient operating times and favorable "squint" angles. AO-13 users who don't wish to participate in the ZRO Test are asked to avoid operating on or near that frequency during these ZRO Test times. Please post the following list of times in your ham shack for the ZRO Tests so that you will have them handy for quick reference:

Saturday July 1, 1989 at 21:10 UTC
Saturday July 8, 1989 at 04:50 UTC
Sunday July 16, 1989 at 07:20 UTC
Saturday July 22, 1989 at 20:50 UTC
Saturday July 29, 1989 at 04:20 UTC
Saturday August 12, 1989 at 20:20 UTC

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. ZRO brochures are available from WA5ZIB, Andy MacAllister,

AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with one unit of postage. The brochure characterizes test procedures, means for obtaining certificates, and gives some historical background about the program. All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

CALL FOR PAPERS FOR JOURNAL

HR AMSAT NEWS SERVICE BULLETIN 154.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 3, 1989
TO ALL RADIO AMATEURS BT

Editor of AMSAT Journal Is Soliciting Papers And Articles For Next Journal

By now, all current AMSAT-NA members should received their first issue of "The AMSAT Journal." With the successful publication of this first issue, Editor Joe Kasser (G3ZCZ/W3) is making an appeal for papers and articles which he will use in the second issue of "The AMSAT Journal." Joe is looking for papers which deal with AO-13 operations, construction projects, software, and in general, articles which deal with all aspects of OSCAR satellite operation. If you have a article you would like to submit for publication, please send it to AMSAT-NA Headquarters, P.O. Box 27, Washington, D.C., 20044, ATTENTION: Joe Kasser. Joe encourages all OSCAR enthusiast to submit your ideas for publication. Perhaps you have built something or have learned something which might be helpful to other AMSAT users -- whatever that might be -- you are invited to write for this "banner" publication of AMSAT-NA.

SB ALL @ AMSAT $ANS-154.05
AMSAT SHORT BURSTS

HR AMSAT NEWS SERVICE BULLETIN 154.05 FROM AMSAT HQ
SILVER SPRING, MD JUNE 3, 1989
TO ALL RADIO AMATEURS BT

AMSAT Short Bursts

AMSAT-NA has learned from Ron Broadbent, G3AAJ, that the launch of RS 12/13 is imminient. This information was made available from reliable Russian sources familiar with amateur satellite activities in the Soviet Union. It is felt by G3AAJ's colleagues in the Soviet Union that the launch of RS 12/13 will occur sometime in June. AMSAT-NA urges all OSCAR enthusiasts to monitor the planned beacon frequencies of 29.408 MHz for RS 12 and 29.4582 MHz for RS 13. The "robot" downlink frequencies for RS 12/13 will be 29.4543 MHz and 29.5043 MHz, respectively. If you should hear the CW beacon on these frequencies for RS 12/13, please contact AMSAT HQ's [(301) 589-6062] so that this information can be passed along to AMSAT Net Control Stations for announcement during the many regular AMSAT Nets each week. Please include the date, time, frequency, your call, and QTH.

The following will be the operating schedules for AMSAT OSCAR-13 for the next several months. Please post this in a convenient place in your ham shack for quick reference.

M de VK5AGR 14May89: *** AO-13 Transponder Schedule Update ***
14May89 to 14Jun89
Mode-JL from MA 160 to MA 200 ! Mode-B from MA 200 to MA 160
Also, for a trial period the OMNI-directional 70cm antenna will
be connected to the Mode-B RCVR from MA 20 to MA 40. These changes
have been introduced to enable stations who have access around
perigee to experiment with perigee operation. Mode S unchanged.
14May89: BLON/BLAT 212.0/+2.4 with a drift rate of 0.016/-0.061 deg/day,
respectively.

O S C A R - 1 3

Date : 14Jun89 until 16Aug89 ! 16Aug89 until 16Nov89
Attitude: 180/0 ! 210/0
Mode-B : MA 0 to MA 110 ! MA 3 to MA 160
Mode-JL : MA 110 to MA 145 ! MA 160 to MA 200
Mode-B : MA 145 to MA 255 ! MA 200 to MA 240
OFF : % ! MA 240 to MA 3
Mode-S : MA 150 to MA 160 ! MA 210 to MA 222

Transponders will be in operation during the whole orbit from June 14 until Aug 16 due to excellent sunangle and power budget. No perigee operation between August and November due to perigee solar eclipses!

AMSAT is seeking additional Area Coordinators throughout North America. These additional members of the Field Operations organization are needed to support the expected inrush of activity and excitement centered about the launch of an additional six or seven amateur radio satellites this year. AMSAT-NA is seeking those who wish to promote the Amateur Radio Satellite program, and primarily, those experienced satellite users who will serve as "Elmers" for aspiring satellite enthusiasts. If you are interested in joining this team of "make it happen" amateurs, contact the AMSAT VP of Field Operations:

Jack Crabtree, AA0P
4327 W. Bellewood Dr.
Littleton, CO 80123
(303) 795-7736

Many AO-13 users are unaware that there is an AMSAT Operations Net which is conducted on AO-13 several times each month to help answer questions about OSCAR satellites and to provide information about the many exciting things going on in AMSAT. The following is a list of the times for the Ops Net. Please place this list in a convenient place in your OSCAR station so that you won't miss out on this interesting net which is offered as a service to all AMSAT members.

Here is the Ops Net schedule through June:

Date UTC orb-phs NCS

04 Jun 0300 746-045 (03 Jun local)
11 Jun 0000 760-152 (10 Jun local)
18 Jun 0100 775-092 W0RPK (17 Jun local)
25 Jun 0300 790-055 (24 Jun local)

Nets can be held on B or JL, but if the AO-13 satellite schedule is changed such that the Ops Net falls during an "off" period, it will be rescheduled. Downlink frequencies are 145.950 MHz and 435.970 MHz for Mode B and JL, respectively. All these are for AO-13 but AO-10 is sometimes used when available.

The following is the operating schedule for FO-12 for the rest of the month of May and for June:

DATE MODE OPERATING PERIOD
06/09/89 JA 04:25 UTC until 21:20 UTC
06/21/89 JA 01:43 UTC until 18:38 UTC
06/24/89 JA 01:03 UTC until 17:58 UTC
06/29/89 JA 00:35 UTC until 15:29 UTC

de DB2OS 01May89: *** AO-10 TRANSPONDER SCHEDULE ***
01May89 to 13Jul89

Mode-B : from MA 025 to MA 225
OFF : from MA 226 to MA 024

All radio amateurs who live in the Northern California area are reminded of the "Shasta SpaceCon '89" which will be held in Weed, CA on June 17th at the Student Center of the College of the Siskiyous. This all day seminar is designed to be a "beginners introduction" OSCAR satellites. Many excellent speakers from AMSAT-NA and Project OSCAR will be present. For more information about this fine seminar, please contact Bob Dalleske (W6AMW) at (916) 964-3154.

ZIMBABWI (Z2) FIELD DAY STATION ON AO10 and 13

The Zimbabwi Amateur Radio Society will be operating a field day station on both Oscar 10 and Oscar 13 on Saturday 17th June as part of the Society's Annual General Meeting which will be held in the capital, Harare on Sunday 18th June, 1989.

The field day will be held on a Range near Harare and is being organised by the Mashonaland Branch of the ZARC. The call sign to be used will be Z21JHE. The satellite station will be on the air from 09:00 UTC till 14:00 UTC.
Predictions indicate that passes of both satellites will

favour VK, ZL, JA and ZS.
The event is being organised by Des Z21GH.

Subj: NETS HELD: net report 6/3 (6/4)

The AMSAT Operations Net was held on 04 June 89 at 0300 UTC (3 June local time) on 145.950 MHz, mode B. Since this was early in the pass with very high squint angles, conditions were expected to be very poor. I found that switching to LHCP on the downlink moderated the severe spin modulation some. Switching polarization on the uplink only made signals weaker without changing the apparent spin signature enough to notice.

There were five checkins, WD0GML, Mike; WB6GFJ, Ross; W6SYA, Bob; WA4UPD, Reid; and WA9PZL, Roger. Net control was wM3

Mike, WD0GML, discussed the new public access sub-board on his BBS which is a SatFoxHunt meeting place. Activity in this area is expected to pick up soon. AO-10 perigee measurements were to be taken this morning by W0RPK and WA9RNQ.

W6SYA was located just a few miles from net control and was heard 59 on the uplink. Net control experienced moderately disruptive intermod and could probably use a more selective front end.

The net was closed at 0323 UTC.

Next week's net will be held at 0000 UTC on 11 June 89, 10 June local in the U.S.

73, Courtney, N5BF

I'm planning to get a beam this summer and am having a hard time deciding which one to purchase. I've pretty much narrowed it down to the KLM KT34XA, the Hygain TH7DX, or the Mosley PRO-67. I've heard and read some good things about both the KLM and Hygain. It seems like the KT34XA might have a slight performance edge over the TH7DX, but not much. I haven't heard or read much about the PRO-67 other than a positive review in 73 a few months ago. The 40 meter capability of the PRO-67 would be nice, although I can't imagine the performance on 40 would be much better than a rotatable dipole. The PRO-67 doesn't use a BALUN while the other 2 do. Mosley claims it isn't needed with their design, but I worry a bit about current flow on the outside of the coax possibly causing problems.

I would really appreciate any information or experiences any of you might have. Thanks.

1135. AM Stereo in AUSTRALIA, CANADA, BRAZIL, UK, NEW ZEALAND, S AFRICA?

Newsgroup: rec.ham-radio
Date: 1989-06-04 21:24:02 UTC
From: klopfens@bgsuvax.UUCP
Message-ID: <4191@bgsuvax.UUCP>
Source record: 18506
Cross-posted to: rec.ham-radio,sci.electronics,rec.audio,rec.video

Does anyone know the status of AM stereo broadcast radio in:

Canada

Australia

New Zealand

United Kingdom

Brazil

South Africa

I'm interested in whether or not there is one standard AM stereo system in use and the growth of AM stereo stations and receivers in those countries. A phone number to the appropriate government agency especially in Canada and Australia would be most helpful.

Thanks.

SpaceNews

MONDAY JUNE 5, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly
around the world. It is available for UNLIMITED distribution.

* RS12/RS13 NEWS *

Ron Broadbrook, G3AAJ has reported that the launch of RS12/RS13 is
imminent and may occur this month. The RS12/RS13 spacecraft package will
operate in a similar fashion as RS10/RS11, and feature transponder modes
such as A, K, KA, KT, T, as well as autotransponders ("robots").

Amateurs are encouraged to listen for this new spacecraft by tuning their
downlink and beacon frequencies. The RS12 beacon is expected to be on a
frequency of 29.408 MHz, while RS13 will be on 29.4583 MHz.
The autotransponder downlink for RS12 will be on 29.4543 MHz, and 29.5043 MHz
for RS13. Those who hear downlinks on these frequencies are encouraged to
notify AMSAT-NA at 301-589-6062, and report the time, date and frequency of
the downlink was heard.

* OSCAR-9 NEWS *

It looks like OSCAR-9 will NOT be taking any CCD pictures for some time.
A revised operating schedule was recently issued for OSCAR-9. Diary software
reloads will still take place on Tuesdays. Digitalker telemetry will follow.
The telemetry channels currently being downlinked via the Digitalker include:

08 : Battery Pack A Temperature (C)
18 : Battery Pack B Temperature (C)
22 : Battery Voltage +14V (Volts)
29 : Spacecraft -Y Facet Temperature (C)
35 : 145 MHz Beacon Output Power (UnCalibrateD)
39 : Spacecraft +Y Facet Temperature (C)
49 : Spacecraft +Z Facet Temperature (C)
59 : Spacecraft -Z Facet Temperature (C)

From Thursday at around 12:00 UTC, the spacecraft will transmit the following
sequence of data at 1200 bits/second:

Telemetry : 60 seconds
News Bulletin : 60 seconds

Whole Orbit Data (WOD) : 150 seconds

This will continue until 06:00 UTC on the following Tuesday when the beacon
will switch off to help facilitate a software reload.

* LAUNCH SCHEDULE *

The following spacecraft are expected to be launched on the date indicated:

RS12/RS13 : June 1989
PACSAT : 09 Nov 89
LUSAT : 09 Nov 89
DOVE : 09 Nov 89
UoSAT-D : 09 Nov 89
UoSAT-E : 09 Nov 89
JAS-2 : 23 Jan 90

* OSCAR-13 NEWS *

The following operating schedule for AO-13 is expected to remain in effect
for the next few months:

Date 14Jun89 until 16Aug89 16Aug89 until 16Nov89
Attitude 180/0 210/0
Mode-B MA 0 to MA 110 MA 3 to MA 160
Mode-JL MA 110 to MA 145 MA 160 to MA 200
Mode-B MA 145 to MA 255 MA 200 to MA 240
OFF % MA 240 to MA 3
Mode-S MA 150 to MA 160 MA 210 to MA 222

Transponders will be in operation during the whole orbit from June 14 until
Aug 16 due to excellent sun angle and power budget. No perigee operation
between August and November due to perigee solar eclipses!

* MAGELLAN NEWS *

As of May 24, 1989, the Magellan Venus probe was 2,919,025 miles from earth.
At that distance, it takes radio signals 15 seconds to reach it travelling at
the speed of light!

Rich Bono (encore!necis!rbono@bu-cs.bu.edu) asks about operating ham radio gear underwater. Skipping lightly over the fact that he's out of his cotton-picking mind :-) :-), it is possible to obtain full face masks on the surplus market. There is no reason why you could not put a small speaker/mike in a surplus full-face mask. One of my friends has one which he only paid a few pounds for. Alternatively, what about a gas mask? Again, these are obtainable on the surplus market for a few pounds. Remove the filter cannister, substitute a regulator, install a small speaker mike and away you go.

SUBJECT: Modems for restricted bandwidth.

There has been recent discussion on modems for 9600 baud. I cant help
but feel that we have been here before. Some years ago (in the sixties -
remember them - flower power, peace, love, and solid-state just beginning to
become accepted) there was a need for Embassies to communicate between
each other. Often using minimal antennas (a loop on the roof, or a 'flag-pole'
vertical) they wanted to transmit data. Now since the embassies are often
sited in residential areas, they wanted to use the lowest transmit power
possible to maintain a reliable circuit. This also reduced the chance of
interception. But they wanted a reliable link. Conventional FSK RTTY
wasnt up to it.
A protocol was developed (by a group here in the U.K. working for Her Majestys
Government) whereby the data was sent as 8 PARALLEL bits. How do
you do this? well each bit controlled an oscillator of fixed frequency. Bit
turned on=oscillator turned on. Since the oscillators were spread evenly
across the audio bandwidth available, you got 8-bit pseudo-parallel data flow.
The early models of the modems were primitive affairs (all transistors, not
a chip to be seen, with L-C tuned filters and a bit of positive feedback to
tighten the bandwidth). RACAL produced the modems and they were widely used
within the UK diplomatic community. I saw a demo of one (in about 1974-75 if
i remember) where the signal-to-noise ratio was absolutely appalling - you
could hardly tell that there was anything there at all amongst the noise - and
the system produced 100% error-free copy.
Because of what the thing sounded like, it was called PICCOLO.
There is a later version of the same thing which uses 32 different tones
instead of eight.
With modern semiconductor/microprocessor systems, i see no reason why we should
not make use of the same idea. Certainly for operation on the 'jagged edge'
where signal-noise ratios are poor, it sure beats RTTY and conventional
FSK modems. Unconventional, but effective. Theres a protocol for almost
all situations. Anyone remember Hellschreibers?

1141. OSCAR 13

Newsgroup: rec.ham-radio
Date: 1989-06-05 16:38:08 UTC
From: gdavis@uvm-gen.UUCP
Message-ID: <1201@uvm-gen.UUCP>
Source record: 18377

Can anyone tell me anything about the orbit of OSCAR 13? I've heard
that it is in an elliptical orbit that always apogees near the north
pole. I assume then,at apogee my direction will be somewhere between
northwest and northest for the down link antenna. However after listening
on and off for 2 days all I've heard is a very weak signal that soon goes
into the noise? Is this as good as OSCAR 13 is at downlink? I'm using a
20 element cross yagi with phasing lines to produce LHC polarization,but
my results to date are disappointing to say the least.
Any info about OSCAR 13's orbit or point of apogee would be helpful;at least
then I will have an idea if my beam is in the correct azimuth heading.

1143. Coded Messages?

Newsgroup: rec.ham-radio
Date: 1989-06-05 17:05:25 UTC
From: flloyd%crank@Sun.COM
Message-ID: <108051@sun.Eng.Sun.COM>
Source record: 18526

I've got two questions which I'd like to open for discussion:

First, I've been wondering about the legality of the following:

A group of hams that congregates regularly on any of several area repeaters is sometimes besieged by jammers and/or malicious interference. When this happens the group will then QSY to another machine. Rather than name the particular machine to whicy they will be QSY'ing to directly, a code word such as "Channel 2" will be used and understood throughout the group.

Is this legal? The regulations state in general that coded transmissions are illegal. Is this a coded or secret message according to the rules?

Second:

Can a person with a Novice licence legally setup and operate a simplex autopatch (simpatch) on a 220mhz novice simplex frequency? Offhand, it sounds like a simple 'No' answer but I can't seem to find it in the regs.

Thanks to all those who may reply.

>> busting these people?

>Because the real police want to keep their jobs, they are not listening
>illegally to telephone calls. The EPCA is a bad law, but once the police
>start violating laws for any purpose, we're all in deep trouble.

So what if the police received "anonymous tips" from citizens....

That way they wouldn't be breaking any laws (win #1) and the *anonymous*
citizens wouldn't be prosecuted (win #2) if they happened to accidentally
hear something on a malfunctioning scanner :-) AND maybe we could reduce
some of the drug problem (win #3) (but how much, really? - security of
larger drug dealings surely is pretty good). I'm not totally comfortable
with the ethics of this since ECPA is still a law - even if it's a bad one.
Still, there is precedent for making good use of "laundered" information
without regard to its source.

'twould be interesting if widespread application of this would hasten an
ECPA challenge...

At least police are aware of how public radio is - I notice they don't
use cellular phones for "confidential" information around here - using
land-lines instead.

Ironic how criminals can listen to police (and cellular calls!) but the
police can't listen to criminals?

.... ..
I have been on USENET for sometime, and finally managed to convince my feed to turn on rec.ham-radio. Looks like I just got my first dose today.

I have been inactive for the last couple of years -- got interested in computing. But I got the bug again. I went into Radio Shack last week needing a couple of parts. I happen to notice a 10 meter rig on the shelf. I figured it would fit real nice in my Chevy van conversion. So I put in a request in for Father's day.

I noticed today a Uniden 2510 advertized in 73 magazine. It looked nice also.

Here is what I 've been leading up to, have any of folks had anything to do with this type of equipment. What are your thoughts about rigs?

If this discussion has been hashed over recently, then I apologize for bringing up again. If that is the case, then e-mail to me would be appreciated.

>a S9? makes it rough to work weak DX.

Well, Jim I have a hunch you didn't take advantage of your employers' discount to buy your AT clone. I did, and was pleasantly surprised to be able to use my HP Vectra ES/12 (12 Mhz AT clone) for logging in the recent CQWW CW contest. I didn't hear a whimper from it, (of course I did have an outdoor antenna, about 50 feet away from the shack, coax feed.) Now if I hooked a short wire, inside the shack, to the rig, I did hear a few weak birdies (s-5 or so), apparently from the monochrome display.

Guess I paid those extra $ for something! ;-)

In reponse to queries about legality

> saying "QSY to channel 2" to avoid jammers on a repeater

As I read 97.117 this is clearly against the rules, since the intent is to "obscure the meaning" of the transmission.

> novices operating "simplex autopatches"

This seems to fall under the definition of auxiliary operation, 97.3.l. Novices are not allowed auxiliary operation by 97.86.e. The intent of the novice rules clearly seems to be that only local and non-radio remote control are allowed.

> Canada for special modes all the time. And how come we are de-regulating
> our bands.
>
> And the big kicker--how come we have a NO-CODE licence. :-)

Let's try again:

Canada is NOT like the US. There are a lot of social similarities, but
the laws in this country are EXPECTED to allow people more freedoms.
^^^^^^^^

Of course this is becoming MUCH LESS SO these days.

1. Because Canada is not so big a market for cellular vendors.
2. I don't know about this... PLEASE send me details (or copies).
3. We are trying to fix that with bandwidth limitations. What modes
can you operate on 33cm?
4. What is deregulating? Letting unlicensed devices on ham bands?
5. We have too many people who try to use law (laws are too easy to make
here) who try to push their way on other people. That mentality,
"I do it that way, so its good enough for you" is the source of the
problem.

>
> Is this legal? The regulations state in general that coded transmissions
> are illegal. Is this a coded or secret message according to the rules?

I suspect it is legal. You have assigned a MEANING to the words, and the words are stated IN THE CLEAR. Anyone who understands English and the term QSY will be able to figure out that you are going to the frequency you have predetermined as being channel 2 in your own context. There is no secrecy involved.

> Can a person with a Novice licence legally setup and operate a simplex
> autopatch (simpatch) on a 220mhz novice simplex frequency? Offhand, it
> sounds like a simple 'No' answer but I can't seem to find it in the regs.

It's an automatic unattended operation *IF* it actually transmits. I don't have the rule book here to see if that is prohibited, so check under that concept. I suspect somehow that it is not legal, but DO *NOT* WRITE TO THE FCC TO ASK IT. If you must write, send it to the ARRL.

Is there somewhere one can get up-to-date frequencies and times for English-language broadcasts to North America for all (or most) shortwave services? I don't want to have to subscribe to a different listing for each country I'm interested in, particularly since it keeps changing. Conversely, I'm interested only in English-language, North America broadcasts.

In particular, does anyone have the current frequencies and schedules for Radio Beijing, Radio Poland, and Radio Tehran?

Source record: 18388

There's been a bit of discussion re the Uniden rigs and the Radio Shack clone in this forum which I won't reiterate. Talking to locals I have heard mixed reports regarding the Ranger line; some like it, some detest it. Real Hams don't like the fact that it doesn't have a Real Tuning Knob.

My own experience leads me to prefer the Kantronics 10M monobander. It's more expensive than the Uniden/Radio Shack (about $330 from AES vs $240-$260 for the Uniden), and has no FM capability, but as an SSB rig it's got far superior recive quality, lower noise and better selectivity. And a much better knob. It's on my short list for things to buy once I unload my Heath SB-200. (Hey, who *needs* 1.2KW on 10M?)

1165. ACC 85 CONTROLLER PROBLEM

Newsgroup: rec.ham-radio
Date: 1989-06-07 14:53:00 UTC
From: ppddc@uwocc1.uwo.ca
Message-ID: <0613220424@uwovax.uwo.ca>
Source record: 18389

One of the local hams has been nice enough to install a 440 repeater in his home with a two meter remote frequency agile transmitter.

He has recently added a DVR to his system. When a DVR message is played and the remote base is on, the controller locks up. It is an ACC 85 and he has spoken to them about it. They have been most helpful with other problems but are unable to find what is causing this, although they are aware of it.

Has anyone experienced this? Any ideas on what is causing it? Any suggestions appreciated.

I too remember seeing a demo of the PICCOLO system in use by
the U.K. DWS (Diplomatic Wireless Service) in the early 70's.
I was under the impression that at any one time only one tone was being
transmitted, but if there were for example 16 possible tones, then
sending a tone was equivalent to conveying 4 bits of information, so
an 8-bit byte could be sent in 2 time-slices.
The thing that impressed me, as a relative newcomer to signal processing,
was the use of so-called 'orthogonal filters' to separate out the
different tones. If I recall correctly, the theory was that if you
hit a narrow band filter with a frequency slightly different to its
centre frequency, the output amplitude varies with time like the
absolute value of a sine wave. This modulates the input frequency, and
looks like a 2-tone ssb test. The periodicity of the amplitude
variation depends on things like the Q of the filter. In any case,
there will be times when the instantaneous output amplitude will be
close to zero for all filters in the bank, EXCEPT the one tuned to the
input tone. The output is sampled at this point, and the filter with
the highest output (usually the correct one) wins the vote. The filters
are then 'damped' and the process starts again with the next input tone.

My fading memory could be wrong, there are probably people out there
who KNOW this stuff...

> include all wiring in the repeater: Audio, Power,
> controller, etc. This (and continuous duty Transmitters)
> is what distinguishes a well made repeater from any old
> mobile rig.

I heartily agree!

Keep in mind, however, that being in the right place at the
right time can reap great rewards in the hunt for commercial
grade repeater equipment.

I have purchased and seen duplexers at hamfests for as little
as $50! These were in working order, but were either on an
unpopular band or split, or needed recabling--not a trivial
operation, but not impossible, either.

There are other deals to be had if you keep a vigilant eye
out. This past Sunday I picked up the essentials of a
Motorola Spectra-TAC voting system for $2.25 ! Yes, the
decimal point is after the first '2', and the guy
even threw in a full-height double sided floppy drive!
What a deal!

Good luck...

> as small as 2x2x3 inches for about $600. The problem is getting the
> transmitter. I want to do this all legally, so I am curious is it illegal
> to sell TV RF transmitters even to licensed ameteurs?

Excellent! That's an old fantasy of mine, and I'm glad there is someone
with the RC airplane experience to try it! Ultimately we might imagine
being able to pan and zoom the camera and sending altitude, attitude and
airspeed telemetry down to a computer for a completely virtual flying
experience! Do keep us posted on how it goes.

It is perfectly legal for anyone to buy or sell amateur radio equipment.
It's just very illegal for a non-licensed person to use it. However, many
manufacturers and dealers will only sell to hams who show their license
or who can be found in the callbook, just to cut out the pirates.
Not because of any law, that's their private choice. That practice is
a bit controversial in some circles, because people studying for their
ham ticket often would like to buy the gear first to have a receiver
to listen to code on. (Please, net, let's not start that discussion again.)

I saw a nice commercial ATV rig at a hamfest last weekend, being shown by
the manufacturer, AEA. It is around 6" by 8" by 2". Another company,
I believe the name is Arcadia, sells boxes and also printed circuit modules
that may be easier to install in the aircraft. They advertise in QST.

Also, many cities have ATV clubs that might be able to help you out.
Try calling your local radio store or asking around.

Best of luck with your excellent project.

Only in america would someone use the solar flux index as
a predictor of stock market activity. But such is the case.
I saw an advertisement this morning on FNN (cable tv financial new
network) where the solar flux index is used (presumebly with other
indicators) as buy and sell signal for stock and commodity trades.

Has anyone seen/heard of the solar flux index or other geomagnetic
indices used for other exotic applications? Maybe there is a hidden
relationship we should know about.

>

David,

I think that this does reflect the kind of society in which we now live. It is not just the stealing of cable service, it is speeding, jaywalking, and all kinds of other laws that people obey only when it is convenient to do so. Unfortunately they are setting an example for their children that it is acceptable to obey the law only when it is convenient and then they wonder why their child is a drug addict or drop out or rapes some one. The child has watched for years others only obeying the law when it was convenient and now he just finds some other law inconvenient to obey. The parent typically says something like "But my speeding does not hurt anyone". But in Phoenix the Police statistics say that the number one cause of accidents in Phoenix is speeding, and the cable company will not survive if all of its customers decide to steal the programming. Even if only one customer decides to steal the programming it raises the cost for the remaining paying customers a small amount.

Just some late night rambling about why one should obey society's laws and if they are wrong work to change them not just ignore them.

Mike

>
> ... questions about the Mosley PRO-67 ...
>
> Wes Nielson WZ7J

Sorry it took me this long to respond. Sometimes I get involved with things and forget. :-)

I have a PRO-67 installed at about 56 feet here in Central New Jersey and it seems to put out a very good signal. Front-to-back and front-to-side ratios are excellent on 20, 15, and 10 meters--so much so that I've actually thought that 15 and 10 were dead at times that I merely had the antenna pointed 90 degrees away from the opening! On 40 meters, I see about a 2 S-unit front-to-back and about the same front-to-side. In contests, I have noticed a definite difference in getting through pileups when I'm pointed directly at the station, so the front-to-side and front-to-back are not my imagination. As you say, I can't imagine that a phased array on a 5-foot boom would have much gain on 40 meters, but it does work better than any dipole I've ever used (including one that was 50 feet high and in the clear). So, the antenna does seem to work.

Now, some warnings. This is not an antenna for the faint-hearted! It's wingspan is 45 feet. The boom is 24 feet. Wind surface area is 12.9 square feet and it weighs 98 pounds (yes, really!). You need a good, solid rotator to handle this beast. Alliance HD-73s need not apply! I made that mistake and the last New Jersey storm destroyed the Alliance--in the windmilling that followed, the coax was pulled apart. But the antenna survives! In any case, a Ham IV is the minimum rotator that I would use with this antenna. But, this is probably good advice for the KLM and Hy-Gain antennas as well.

If you're seriously considering the PRO, you might want to wait until July, when the PRO-67A will be coming out. Conversations with Gary, K0VUW, at Mosley indicate that there is a modification coming out that will improve the SWR on the 18 and 24 MHz bands (yes, the PRO covers the WARC bands). I seem to recall that the original design had the resonances somewhere near 18.5 and 24.5 MHz and Mosley is now getting around to changing them to the right places.

Hope you find this information useful. Frankly, any of the antennas you mention should work dynamite for you. I know people who use the KT34XA and the TH7DX and they both perform very well. Hell, Steve, N2IC/0 uses a KT34XA and he's always in the Top Ten in all the major contests, so the antenna must be good! Can't be Steve! :-) :-) :-)

> Is this legal? The regulations state in general that coded transmissions
> are illegal. Is this a coded or secret message according to the rules?

To some extent all transmissions are "coded" since the sender relies on
a common base of understanding in order to transmit his or her intent.
A conversation may even be carried on in a foreign language (as long as
callsigns are transmitted in English).

Tactical names are often used in nets for stations and/or frequencies to
aid in the efficient handling of information. Control might ask an operator
to relay some information to the "Resource Net" or to go to "Red Cross 1".
As long as stations ID with their callsigns at proper intervals, tactical
names can be used. Although it may be "code" to some, its primary function
is to facilitate information flow.

Let me elaborate on why I think all transmissions are to some extent "coded".
As a contrived example, let's say I asked my friend if he/she is going to
"the meeting tonight". Do I have to explain to everyone listening where the
meeting is (including directions to those who might need them), when it will
be held, and the adgenda? All of these things are known to the listener,
but could be taken as "code" by another ham. (Oh no, a secret meeting!) :-)

Repeaters often have control functions accessable via coded tone sequences.
The security of the repeater depends on the secrecy of those sequences.
Is it illegal to send coded tone sequences whose function is only known
to the sender?

I guess I've rambled long enough. To summarize, if "qsy to Channel 2" meant
"meet me at the junkyard at 7pm to make a pick up" it would be illegal.
If, however, "qsy to Channel 2" is simply a means for accurately and
efficiently conveying your desire to change to a different frequency...

RTTY DX NOTES FOR WEEKENDING 2ND JUNE 1989

THE PAST WEEK HAS BEEN A RATHER FRUSTRATING WEEK IN SOME WAYS. STATIONS
THAT WERE SUPPOSED TO APPEAR, DID NOT, AND THOSE THAT DID, ONLY APPEARED
FOR SHORT PERIODS DUE TO OTHER COMMITMENTS. BUT IN SPITE OF THE
FRUSTRATIONS THERE WERE SOME GOOD DX SIGNALS AROUND THE PLACE, AND WE HOPE
FOR BETTER SIGNALS IN THE NEAR FUTURE.

OUR THANKS THIS WEEK GO TO TG9VT, W1DA, OD5NG, W6/G0AZT, G3XTL, AND VK2EG.
THANKS CHAPS, FOR THE INFORMATION. YOU ALL MAKE THESE NOTES WHAT THEY ARE.

1180. more Radio Beijing frequencies

Newsgroup: rec.ham-radio
Date: 1989-06-08 06:09:23 UTC
From: karn@ka9q.bellcore.com
Message-ID: <16706@bellcore.bellcore.com>
Source record: 18404

I pulled this message off Compuserve. I don't know why the frequencies don't match those that were posted earlier from the WRTH. --Phil

#: 99771 S3/ShortWave Listening
07-Jun-89 21:03:24
Sb: #99751-Beijing & Shortwave List
Fm: Allan Courtney 75146,1240
To: cleveland thornton 74746,1422

Cleveland,

Here is an excerpt of the full English language schedule for Radio Beijing that was printed in the May issue of FRENDX, the Journal of the North American Shortwave Association. I am only giving you the times and frequency to North America, as those should provide the best chance of hearing it.

Eastern NA:
0000 17855, 17715 (via Mali), 15130 (via Mali)
0300 15130 (via Mali), 11715 (via Mali), 9690 (via Spain)
0400 11840 (Via Canada), 11685 (via French Guiana)
1100 17855
1200 17855

Western NA:
0300 17855, 15130 (via Mali), 11715 (via Mali), 9690 (via Spain)
0400 15195, 11840 (via Canada), 11685 (via French Guiana)
1300 11855
1400 11855

All times are UTC and all frequencies are kHz. Your best bets are the relays at night (0300 or 0400). If you want to hear it directly from China the best bets are the morning transmissions (1100-1400). Good luck!

Allan

1181. Re: Are there hams in China?

Newsgroup: rec.ham-radio

Cross-posted to: soc.culture.china,rec.ham-radio

CNN had a story on about an amateur radio operator in California who had developed a friendship with the first licensed Chinese amateur radio operator in 1984. They regularly communicated on HF. The CNN story said that amateur communications into and out of China have been sporadic in the last couple of days (not due to propagation but government/military restriction and intervention). The CNN story also stated that there are only about 12 amateur radio stations in China, and they are all in Universities. I can't remember the name or the call of the US amateur in California. Perhaps somebody else can.

1182. Reasonable foxing recievers...?

Newsgroup: rec.ham-radio
Date: 1989-06-08 12:24:22 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <147990@Wayne-MTS>
Source record: 18406

While working on my various fox-hunting projects, I find myself in the need of one or more reasonable priced FM and perhaps multi-mode recievers for automobile and sneakermobile use.

I've been using my Icom 251A in the car, but it's rather bulky and difficult to shield, given the size. My FT-23 lacks a really good S-meter and my Regency HR-2B is rock bound, which is ok for local hunts but could break the bank if I started buying all the crystals I'd need.

What I'm looking for is suggestions of used equipment I should be looking for in 2m gear. The ideal reciever or transciever should be synthesized or even tuneable, but *not* microprocessor controlled. It should have a decent S-meter, or be reasonably easy to add one to. Even a small s-meter means that I can easily add an external meter. Finally, it should be small enough to put in a shielded box on my dashboard, and cheap enough that I can buy a couple if necessary.

(Anyone got a price on that new ICOM "IC2" yet...?

1183. Yaesu FT757-GX Battery problem

Newsgroup: rec.ham-radio
Date: 1989-06-08 13:14:41 UTC
From: PAYCON2@MITVMC.BITNET
Message-ID: <8906090737.AA00667@ucbvax.Berkeley.EDU>
Source record: 18407

I have a Yaesu FT757-GX, which has had the memory battery die twice since I got it, once after I had it for around 4 months, and again after I took it back for a battery replacement (the second one lasted only a few months too.)

Could anyone send me instructions for replacing the battery myself? I can't find anything in the rig's documentation about it, and the shop where I bought it (EGE/Ham Radio Outlet in New Hampshire) no longer does repairs. Has anyone had a similar problem, or know anything about it? Thanks in advance, and 73 from N1EVX.

There must be some trick to getting this "marvin" call sign server to work.
I can do a "telnet 128.205.32.4 2000" and get conected with no difficulty,
and there is no prompt, as was mentioned on the net, but I have tried
repeated different call signs, using ones from the signature blocks of
messages on Info-Hams, so I know they are good call signs, and I have
never gotten any response from the remote system at all. I've tried both
upper and lower case, if that makes any difference. Is there any command
a caller can give that system to see that it is actually up and working?

Regards, Will Martin

>Has anyone seen/heard of the solar flux index or other geomagnetic
>indices used for other exotic applications? Maybe there is a hidden
>relationship we should know about.

I saw a graph of just this in the _Boston Globe_ about a year ago. I had it hanging on the wall outside my office for a month or so. According to the graph, the stock market did somewhat track the sunspot cycle. I dismissed it as coincidence, but I'd like to hear if anyone has made money on this stuff.

I designed a heterodyning receiver for my undergraduate thesis and swept the stock market (Dow Jones Industrial Average since 1898) for frequency peaks, and used these peaks to build a model. The model kinda missed the October crash, and it's falling now while the market is really rising.
Oh well.

1187. Re: OSCAR 13 - HELP

Newsgroup: rec.ham-radio
Date: 1989-06-08 15:07:38 UTC
From: chris@hplvli.HP.COM
Message-ID: <4590026@hplvli.HP.COM>
Source record: 18411

OSCAR signals are not strong, as the satellite is designed
for minimum power required to carry maximum bandwidth of
transponders (with minimal budgets). You should have a
good idea of where the satellite is, using the orbital
prediction software and your local coordinates. AO-13
is in a Molniya orbit, so it will seem stationary for
several hours at apogee, so continuous tracking will not
be necessary for use. Remember also that the various
transponders are on at different parts of the orbit, so
be sure you are listening at the right time for the
frequency of interest. A computer is very helpful in this
process, and AMSAT will sell software for IBM compatibles
and Apples, and Commodore C64s. (remember AMSAT is a
volunteer organization and needs financial support to build
satellites, so please don't begrudge the cost of software).

To hear AO-13 well, you should have a good antenna,
preferably with a good GaAs FET preamp at the antenna.
Good feedline (9913 or Heliax are good choices).
The KLM antennas are probably the best choice, for their
good design and efficiency. Remember, any loss at the
antenna is lost forever, and cannot be recovered with
amplifiers if your Signal To Noise ratio is lost.
Invest first in the antennas, to get a good start.

In preamps, remember there are GaAs FETs and Bipolar
preamps, and among GaAs Fets there are low noise and
some with not-so-low noise. You get what you pay for,
and Advanced Receiver Research (ARR) preamps have my
vote for performance and quality. Some others costing less
have such high noise figures that you are wasting money
to buy the name "GaAs" on the package. Gain is NOT the
issue here, Noise Figure IS the issue, and higher S-Meter
readings do NOT constitute better signal-to-noise ratio,
if the preamp is just amplifying noise (or worse, generating
noise!).

Finally, the feedline is also an important issue.
Normal RG-58, RG-8X and RG-8U or AU have enough loss to
make un-amplified signals disappear on their way from the
antenna to the receiver.
Low loss designs, such as 9913 or 9086, use air dielectric
(with a polyethylene spiral to keep the center conductor
centered) and have very low loss at the VHF and UHF frequencies.
For a few dollars more, Andrew "Heliax" (trademark) is

also a good choice with lower loss, but probably overkill
for most "normal Hams" (an oxymoron?).

Hope this helps, and 73...de WD5IBS ....chris

1188. Frequencies for Radio Teheran (Was: Re: Shortwave Info Wanted)

Newsgroup: rec.ham-radio
Date: 1989-06-08 15:59:22 UTC
From: sdry@vax5.CIT.CORNELL.EDU
Message-ID: <18760@vax5.CIT.CORNELL.EDU>
Source record: 18412

I was recently able to tune in to the Voice of the Islamic Republic of Iran
on 15084 and 9022 kHz (the first frequency being usually better). Most of
their broadcasts are in farsi, though; I couldn't get the english service,
but the spanish service is at 0130 UTC, and is repeated at 0630 UTC. It wasn't
very interesting: every second sentence referred to "el cuerpo puro del
Imam"...
Both frequencies are out-of-band (although not by much in the case of
15084), so you may be in trouble if you don't have continuous coverage.

1189. CNN coverage of chinese ham radio

Newsgroup: rec.ham-radio
Date: 1989-06-08 18:22:30 UTC
From: karn@ka9q.bellcore.com
Message-ID: <16709@bellcore.bellcore.com>
Source record: 18413

CNN Headline News just carried a story about amateur radio from China, or more accurately, the lack thereof since Saturday. K6ITL and his station were shown, with calls to BY1PK going unanswered. He was also shown using a packet BBS to exchange information with locals on any other sightings of BY callsigns.

The story then went on to say that regular telephone communications with China, including FAX, are being squeezed off. Chinese students in the US were reporting that they could no longer be sure of who they were speaking to on the other end, if they could get through at all.

A related question: has anyone heard reports of how effective the VOA and BBC (or any other western shortwave service) have been in covering Beijing? Somebody mentioned here that the VOA recently fired up a standby transmitter in Taiwan; has it been able to overcome Chinese jamming?

Several people have been flying TV equipped model aircraft for many years. There are a pair that fly out of the Whittier Narrows field in the LA area that have been competing with each other for in fanciness and bells & whistles. One put in a camera, the other upgraded to a color camera, and so it goes. They've used both telemetry and split screen optics to include on-board instruments in the camera field.

You may be able to get in touch with these guys through the San Gabriel Valley Radio Control Club. I don't have their address, but you should be able to get it from the Academy of Model Aeronautics. Check any model aircraft magazine for their address or phone number. They can also provide you with info on other groups who are working on similar projects.

BTW, the May issue of Model Aviation (the AMAs pub) includes an extensive article on remotely piloted vehicles (RPVs), with particular attention devoted to model aircraft spin-offs. I'm sure you'd find it interesting.

1192. Re: how to learn cw

Newsgroup: rec.ham-radio
Date: 1989-06-08 23:57:31 UTC
From: pat@hprnd.HP.COM
Message-ID: <1140011@hprnd.HP.COM>
Source record: 18416

How are you practicing? What tapes and code speed are you using?
How long do you expect it to take.

There are a number of different techniques and what's good for one
person may not be best for another. I also tried and gave up
several times. My 13 year old took a local class and got his
license. His brother (8 years old) wanted to get one to but
was getting very frustrated with code practice, so I started
to practice with him. What I noticed was that the tapes he was
using were too boring and frustrating. They were all random
code practice. I went to a local radio store and they recommended
the Gordon West tapes. Several of them have code on one track
and voice on another so you hear what the letter or word was
after the code and get immediate reinforcement. Gordon also
cheers you on so the tapes seem a little friendlier.

Several other things are important.

Don't try to distinguish the dots and dashes. Instead listen
for the rhythm pattern of the characters and words. One
learning method uses a phrase of similar rhythm as a pnuemonic
for each character. For instance, / is "shave and a hair cut."
There is suppose to be a tape set for this method. My son was
taught it in his class.

Character speed should be 13 words per minute. The spaces between
the letters and words are lengthened so that overall speed is 5
words per minute. Characters loose their rhythmic character at
slower speeds and it is much harder to learn. The 5 word per
minute test is given with a 13 wpm character speed.

Some people suggest that it is easier to start with the longer
characters (l, f, y, q, etc) rather than the short ones (e, i, a)
as they have more rhythm.

I found three kinds of practice helpful: QSOs (get you use to
what will be on the test), random (greater frequency of the
less common characters) and call sign/number.

It is usually better to practice 15 minutes at a time a few
times a day than in larger less frequent blocks. If you do
practice for extended times, varying the tone frequency seems
to help.

Practice with a friend. It can help you pace yourself and
make you feel like you are getting somewhere.

After a few weeks, I passed the novice test and my son passed it after 8 weeks. When I had tried to study earlier, I found the same problems you mentioned and I don't have a good sense of rhythm.

Good luck from someone else who "Couldn't pass the code test."

1195. Radio Beijing frequencies

Newsgroup: rec.ham-radio
Date: 1989-06-09 05:11:24 UTC
From: karn@ka9q.bellcore.com
Message-ID: <16747@bellcore.bellcore.com>
Source record: 18419

I've been monitoring Radio Beijing's English service for the past few hours. All they do is read mundane news about the rest of the world for a few minutes and then play Chinese music for the rest of the hour as though nothing unusual was happening. Absolutely incredible. Who do they think they're fooling?

Here's the frequency list as given at the end of the broadcasts on 9690 KHz at 0300 UTC and 11685 KHz at 0400 UTC. These were apparently aimed at the West Coast of the USA, hence the times were originally given in Pacific Standard (note: not daylight). I added UTC times in brackets. There could be errors in this list, as it was read quickly.

5AM PST [1300 UTC] 11855
6AM PST [1400 UTC] 11855
7PM PST [0300 UTC] 17855 15130 11715* 9690* *=confirmed by KA9Q
8PM PST [0400 UTC] 15195 11840 11685*

They also invited listener reports and comments at the following address:

English Dept
Radio Beijing
Beijing 500866
China

Write and give 'em a piece of your mind!

1196. MARVIN call sign server

Newsgroup: rec.ham-radio
Date: 1989-06-09 17:18:00 UTC
From: Ed@ALDERAAN.SCRC.SYMBOLICS.COM
Message-ID: <19890609171810.2.ED@BLACK-BIRD.SCRC.Symbolics.COM>
Source record: 18420

Date: Thu, 8 Jun 89 8:28:24 CDT
From: Will Martin <wmartin@ST-LOUIS-EMH2.ARMY.MIL>

There must be some trick to getting this "marvin" call sign server to work.

I had problems with it too. In my experience, it doesn't prompt, doesn't echo,
and will say either:
Call-Sign: K1ZZ Class: EXTRA
Real Name: DAVID G SUMNER Birthday: APR 22, 1949
Mailing Address: 684 CEDAR SWAMP RD, COVENTRY, CT 06238
Station Address: SAME AS MAILING ADDRESS
Valid From: SEP 3, 1985 To: SEP 3, 1995
Records Last Processed: SEP 3, 1985
or
Unknow callsign: K1ZZZ
(sic). It accepts lower-case callsigns, too.

I've tried the telnet user programs on a number of machines, with varying
results. My current best theory is that there are two bugs: one in the
MARVIN server and one in some user telnet programs. The bug in the server
is that the callsign has to arrive in one packet, rather than arriving as
separate packets for each character you type. You can get around this bug
if your telnet user program has an option permitting "line at a time"
operation. The telnet user bug is that some user programs exit immediately
when the connection is closed, without ensuring that they type out all the
buffered data preceding the close. Use another network vendor, or write
your own program (if you have a Symbolics Lisp machine, send me mail and
I'll send you my program).

1197. Looking for Mac SW for CW (Morse Code)

I'm just starting out trying to get my Novice, then Tech, license, and
am wondering if anyone has software to practice or learn Morse on the Mac?
I have an SE at home, and would be very pleased to be able to practice
on it...

Send email, please, since I don't read comp.sys.mac at all and only read
rec.ham-radio once a week or so.

Thanks,
_Strata

I discovered a way around the fact that the callsign server wouldn't work
for me, but still don't know just what was going wrong. It WILL work OK
if I run the telnet from our VAX 750 running 4.3BSD UNIX; it won't work
at all running it from our Sperry/Unisys systems running System V.2 UNIX
with the Sperry-supplied version of telnet.

Lord knows why...

Regards, Will Martin

I am also running a callsign server on ka9q.bellcore.com, port 2000.
(The IP address is 128.96.160.1). Just telnet to it and enter a
callsign followed by return. You can enter any number of requests
per session; when you're done, close the connection from your end.

Here are a few comments of my own about satellite downlink antennas. On two meters, there is no real substitute for having sufficient aluminum in the air. This is because the cosmic background noise is quite high on 2 meters, and in most situations it is the limiting factor in system performance.

The cosmic background averages several hundred Kelvin in most places and reaches several thousand Kelvin in the direction of the galactic center. This means that in many cases, your overall system signal-to-noise ratio has already been established at your antenna terminals. Yes, a GaAsFET preamp can help to keep the signal from degrading further due to feedline losses or a noisy RX front end, but it can't improve the signal beyond the quality seen at the antenna terminals. There's not much point in paying extra money for the very best preamp on the market; almost any 2m GaAsFET preamp will work well enough to not be the limiting factor in system performance.

Going to a larger 2m antenna, on the other hand, *will* improve the signal to noise ratio, assuming you can keep the antenna accurately pointed. The extra gain increases the signal level while the noise energy remains constant. (This assumes that the sky noise is uniform over the antenna apertures being compared; if going to a bigger antenna helps you to exclude a particularly noisy portion of the sky, then you win even more because the received noise energy will decrease at the same time the desired signal increases.)

The situation on 70cm is somewhat different. Here the cosmic background is much lower (typically 50-100K) so it often does make sense to invest in a really good low noise preamp. And you must pay attention to EVERYTHING in the signal path: quality of connectors, quality of coax, location of preamp, etc. But the most important element (ah hem) is still the antenna itself.

I find curious the FCC's desire for station location information for those
who have their stations at their mailing address. After all, if the USPS
can find you, why can't the FCC?

I suggest you give an appropriate description that follows this scheme:

Johnson Corner Road n miles [north|east|west|south] of [some landmark
or an intersection with another road]

I wouldn't be too hard on them. Right after the massacre, one of the
Radio Beijing English announcers told the *truth* about it, and expressed
the regrets of the Radio Beijing English Department, before he was yanked
off the air (see article <2290@blake.acs.washington.edu>). One shudders
to think what might be happening to him, if he still lives.

Given that, one can understand why the Radio Beijing English Department
might be reluctant to to say anything about the current events in China.
Umpteen secret policemen are probably watching every word.

I used to have a Hygain TH6DXX and now have a KLM34XA. The Hygain
was much better mechanically than the KLM. I bought the KLM for
a song from its original owner who didn't want to rebuild it. It
goes thru insulators every five years or so, and has condensation
problems in the tube capacitors during damp weather. Also, the
"straps" used in the folded elements keep loosening. I just fixed
the 15 meter one last year and it's going out again. The only
good thing about the KLM is it covers the high end of 10 meters
a little better. I never had a bit of trouble with my TH6 and
neither did numerous friends who owned them.

ARRL DX NR 23 (ARLD023) 6/9/89

THANKS TO WB2CJL AND THE WESTERN NEW YORK DX ASSOCIATIONFOR THE FOLLOWING DX INFORMATION.

TUVALU. K6EDV AND ZL1AMO WILL BE ACTIVE FROM JUNE 10 THROUGH 25.

CHAD. A SECOND OPERATOR WILL ASSIST F3CW IN HANDING THE TT8CW CONTACTS, AND SHOULD BE ACTIVE FOR THE NEXT 13 WEEKS. QSL VIA F2CW.

MARION ISLAND. PETER HAS BEEN VERY ACTIVE ON 10 THROUGH 20 METERS, WORKING BOTH SIDEBAND AND CW, LISTENING UP. HE SHOULD BE ACTIVE SOON ON 40 METERS. QSL VIA ZS6PT.

GLORIOSO. FR5AI/G, YOLAND, HAS BEEN ACTIVE ON 20 CW. HE WILL BE THERE FOR ONE MORE WEEK.

ROTUMA. BING, VK2BCH, WILL BE ACTIVE AROUND THE END OF JUNE FOR THIS ONE. QSL VIA HIS HOME CALL.

SOMALI. T5CT WILL BE ACTIVE FOR TWO YEARS, WITH OPERATOR N4CT. QSL VIA K4CIA.

CH3, ONTARIO, AND CJ1PEI, PRINCE EDWARD ISAND. AMATEURS IN ONTARIO MAY REPLACE THEIR VE3 PREFIX WITH CH3 JUNE 7 THROUGH JULY 7 IN CELEBRATION OF THE 50TH ANNIVERSARY OF THE QUEEN ELIZABETH HIGHWAY BETWEEN FORT ERIE AND TORONTO, ONTARIO. CJ1PEI WILL BE ACTIVE DURING THE MONTH OF JULY IN CONJUNCTION WITH THE INTERNATIONAL SCOUT JAMBOREE BEING HELD ON PRINCE EDWARD ISLAND.

MARKET REEF. SEVERAL OPERATORS WILL SIGN OH2AP/OH0 THROUGH JUNE 14, WITH CW, SSB, RTTY AND 160 AND 6 METERS PLUS SATELLITE, ON THE USUAL DX FREQUENCIES. ALSO, SI8MI WILL BE USED FROM THE SWEDISH SIDE OF THE REEF. THIS COUNTS AS SWEDEN FOR DXCC. QSL VIA OH2AP.

NORTH KOREA. REPORTS SAY THAT UB5JRR WILL BE IN NORTH KOREA JULY 1 THROUGH 7 AND WILL TRY FOR OPERATING PERMISSION. THIS OPERATION WILL NOT AUTOMATICALY ADD A NEW ONE TO THE DXCC LIST. THE DXAC, ACCORDING TO THE DXCC DESK, WOULD HAVE TO RENDER A DECISION.

RARE OBLASTS. UI8U AND UH8W. BEGINNING JUNE 26 OPERATORS FROM CLUB STATION UZ4FWD WILL OPERATE FROM RARE OBLASTS 055 AND 045. THEY WILL BE ACTIVE ON ALL BANDS AND MODES, WITH EMPHASIS ON RTTY.

MADEIRA ON 6 METERS. G4HGT/CT3, IN GRID SQUARE IM13, WILL BE ACTIVE
ON 6 METERS THROUGH THE 16TH. THEY WILL BE ON FOR THE VHF CONTEST
THIS WEEKEND AR

ANARC Convention Agenda FRIDAY, 14 July:

10 a.m. - 7 p.m. Registration and exhibition (Royal Dolphin Room)
11 a.m. - 12 n. Press conference for local media (Plantation Room)
11 a.m. - 2 p.m. Videos from the ITU Library (Cypress Room)
2 p.m. - 4 p.m. ANARC Club Representatives meeting (Plantation Room)
4 p.m. - 5 p.m. "Radio Receiver/Computer Interfaces" by Richard Merz of San Lorenzo Software (Cypress Room)
5 p.m. - 6 p.m. "New Shortwave Modulations" by Fred Osterman of Universal Shortwave (Cypress Room)
7 p.m. - 9 p.m. Poolside Reception, sponsored by World Radio TV Handbook
9 p.m. - 11 p.m. Radio Comedyfest: Laurel & Hardy's "Hog Wild" and other film-shorts (Cypress Room)

ANARC Convention Agenda SATURDAY, 15 July:

9 a.m. - 5 p.m. Exhibition opens to local public today (Royal Dolphin Room)
9 a.m. - 10 a.m. "TWR Bonaire" slide-tour by Chuck Roswell (Cypress Room)
10 a.m. - 11 a.m. "NDXE's Vision" by H. Dickson Norman (Cypress Room)
11 a.m. - 12 n. "Interference-Reducing Antennas for Shortwave Listeners" by O. G. Villard of SRI International (Cypress Room)
12 m. - 1 p.m. Lunch Break
1 p.m. - 2 p.m. "Two-Way Radio for Launch Ground Support at the Kennedy Space Center" by Alan Parrish of NASA (Cypress Room)
2 p.m. - 3 p.m. "The State of Clandestine Radio Broadcasting in Latin America" by John Santosuosso of Florida Southern College (Cypress Room)
3 p.m. - 4 p.m. "The Role of Radio in the Democratization of Panama" by Panamanian Senator/radio broadcaster Mayin Correia (Cypress Room)
4 p.m. - 5:30 p.m. "International Broadcasters Forum" (Cypress Room)
6 p.m. - 7 p.m. Cash bar
7 p.m. - 8 p.m. Poolside Buffet Banquet
8 p.m. - 9 p.m. Awards Presentations and keynote speech: "Radio Marti in an Era of Glasnost" by Ernesto Betancourt, Director of Radio Marti
10 p.m. - 12 m. Live recording session for programs by Radio Netherlands' Tom Meyer and Alfonso Montelegre (Cypress Room)

ANARC Convention Agenda SUNDAY, 16 July:

9 a.m. - 10 a.m. "Border Radio" by Bill Crawford, author/broadcaster (Cypress Room)
10 a.m. - 11 a.m. "The ANARC Forum" moderated by Robert Horvitz
11 a.m. - 12 n. "World Radio-TV Handbook Quiz" with Andy Sennitt, WRTH

editor (Cypress Room)
Sunday afternoon Free for beach activities, sightseeing, check-out.

MONDAY, 17 July:
9 a.m. - 11 p.m. Optional all-day trip to Orlando, Florida to either Disney World or Epcot Center. Buses will pick up and drop off at the Dolphin Beach.

CONVENTION EXHIBITORS (as of 1 June): Radio RSA, Radio Korea, Broadcasting in Venezuela, World Radio TV Handbook, SPEEDX, SRI International, San Lorenzo Software, Universal Shortwave Radio, Trans World Radio, Voice of America, HCJB, Red Cross Broadcasting Service, Radio Clarin International, Radio Marti, Radio Grenada, NDXE, World Wide Christian Radio.

>
>While we're talking about mods, can someone either send me a list of mods
>for the Kenwood HT-45A (handheld, 440) and/or tell me where to ftp or uucp
>any "master lists" from?
>

Ok, I've promised it for a long time and now it's time to live up to my promises. Here are some mods for the TH-25AT and the TH-45AT. Please note that I do not encourage transmitting on a frequency for which you do not have a license, nor do I encourage transmitting on a non-amateur frequency without FCC type accepted equipment (in the United States). Lament: when are the Japanese going to produce a 440 FM HT for the US market that has receive coverage outside the US amateur band? Lord knows that there's a market for it - there's MONEY to be made.

First let me recommend that you buy the service manuals for these radios. The service manual is not expensive (about $15 I think) and it will greatly help you in performing these modifications.

Look at the schematic for your radio. In the lower left hand corner is an IC labled IC2. This is an ASIC microprocessor. At the lower right hand corner of this uP are several diodes and pull-up/pull-down resistors. They are D4, D3, R19, R18, R28, R20, R21, R22, R25, R26, and a couple of resistors that are not even on the schematic that attach to B2 (pin 51 on IC2) and B3 (pin 50 on IC2). The TH-45AT schematic shows R23 on the ASIC uP pin B2.

The schematic for the TH-25AT shows:

```
R18-R21 R25 R26,27 R28 R36
TH-25A M,M2 -12 O X X X X
TH-25A M3,M4,X -23 O X X O X
TH-25AT K -11 O O X X X
TH-25AT M,M2 -12 O X X X X
TH-25E T -52 X X O O O
TH-25E W -62 X O O O O
```

And the schematic for the TH-45AT shows:

```
R19-R21 R22 R23 R25 R26,27 R28 R36
TH-45A M1,M2,X -21 O O O X X O X
TH-45A M3,M4 -22 O X O X X X X
TH-45AT K -10 O X O X X O X
TH-45AT M1,M2 -21 O O O X X O X
TH-45AT M3,M4 -22 O X O X X X X
```

TH-45E T -51 X O X X O X O
TH-45E W -61 X O X O O O O

where O means USED, and X means NOT USED.

Some of the above codes are:
K USA
T England
X Australia
M Other Areas

These components are found on the flexible circuit board under the display. To get to them, take the radio apart. Some unsoldering of obvious grounding wires may be necessary. You will see where the flexible circuit board plugs into a socket on the main circuit board. Before unplugging it, make sure you know what's in the memories, because they will be lost. Unplug the flexible circuit board and unfold it so that the components are accesable. One of the fold-out parts of the flexible board will look something like this:

```
+----------------+
| R R R D3 R R |
| 2 2 2 7 2 |
| 5 3 2 1 |
| |
| R O O R20| The O's are solder pads.
| 2 O O R19|
| 6 O O R18|
| O O R28|
| |
| R |
| D4 6 |
| +-------+
| |
| |
```

The fold out board is actually square, but with only characters for graphics, I couldn't draw it that way.

On both radios, R36 is for the European tone burst to "whistle up" repeaters.

On both radios, D4 is for selecting the type of display. With D4 in, the display is normal. With D4 removed, the display is a channel display.

D3 is for selecting VHF or UHF. With D4 in, the radio thinks its a VHF radio. With D4 removed, the radio thinks its a UHF radio. Don't change this on your radio.

On the TH-25AT:
(All frequencies given in MHz.)

R22 in
R28 out
This is how the radio is delivered in the USA. TX 144-148, RX 141-163
(I think).

R22 out
R28 in
The radio tunes from 142-151. This may be the modification given
to US MARS members. I don't remember where the unit will transmit. It
may or may not transmit outside the range from 144-148.

R22 in
R28 in
The radio tunes only from 144-148.

R22 out
R28 out
Frequencies may be selected from 100-200 MHz (on the display only - your
PLL will not lock up in this entire range). In addition, TX is possible
where your PLL locks up.

R25 out
Removing R25 disables automatic offset selection.

R23 and R24 are used for selecting the step size for tuning. I can't
remember which positions are for which step sizes, and alas I didn't
write down what I found. If you want to play with this, go ahead.

On the TH-45AT:
(All frequencies are given in MHz.)

R18 in
R28 in
This is how the radio is delivered in the USA. The radio covers
438-450 MHz.

R18 in
R20 out
The radio is prohibited from tuning outside 440-450 MHz.

R18 out
R28 in
The radio will only tune from 215-230 MHz. Note that the PLL would not
lock up! (What did you expect?) Could it be possible that Kenwood
originally planned a 220 version of this radio, but then scrapped their
plans?

R18 out
R28 out
The radio will tune from 200-500 MHz (on the display only - your PLL
will not lock up over this entire range). Transmitting is possible
anywhere your PLL will lock up.

I have found a quick and easy way to retune your PLL (in the TH45-AT)
with a minimum of test equipment. All you need is a scope and a small

tuning tool. First, take off the battery pack holder plate. Then, remove the silvery sticker covering the tuning pot access holes. If the radio is positioned on its back, with the top folded over so that the touch tone pad is also facing down, the test point you want (TP1) is on the bottom half of the radio, near the center (left to right), and close to the battery; the tuning pot you want (TC1) is on the bottom, and closest to the PTT switch. Under no circumstances change the tuning of TC51. This is used to calibrate the output of the radio with the display the radio is giving; you don't want to mess with it. Once again, the Service Manual makes it very clear where these points are, if you are having trouble with my descriptions. On with retuning the PLL. With the radio on, and receiving, monitor the voltage and the waveform on test point TC1. Tune the radio DOWNWARDS in frequency until the PLL unlocks. Note that the radio will beep when this happens, and the waveform on TP1 will change. Tune the radio about 1 MHz higher so that the PLL locks up again, and note the voltage on the testpoint, TP1. Now, tune the radio to the LOWEST frequency that you want to be able to receive. Adjust TC1 until the voltage on the test point TP1 is the same as what was noted earlier. Button the radio back up, and you're done. You will not be able to tune the PLL to any range you want. There are limits. On my radio, I have been able to retune the radio so that I can recieve from 439.2-468.6 MHz with a set of batteries fresh out of the charger. The tuning range will probably diminish as the battery voltage decreases. I have not retuned the PLL on my 2m HT, but I'd imagine the same technique will prove fruitful.

I may have some more information on these radios someplace. If I can find it, I will add to this posting, and post it again with the updated information. Enjoy.

In article <1140011@hprnd.HP.COM> pat@hprnd.HP.COM (Pat Thaler) writes:
+ Don't try to distinguish the dots and dashes. Instead listen
+ for the rhythm pattern of the characters and words. One
+ learning method uses a phrase of similar rhythm as a pnuemonic
+ for each character. For instance, / is "shave and a hair cut."
+ There is suppose to be a tape set for this method. My son was
+ taught it in his class.

This sounds like an interesting method. Got the rest of the list?

1212. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-06-11 03:12:38 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8906110702.AA13786@ucbvax.Berkeley.EDU>
Source record: 18343

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

1213. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1989-06-11 03:13:00 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8906110701.AA13768@ucbvax.Berkeley.EDU>
Source record: 18342

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

**** UoSAT-OSCAR-11 BULLETIN - 188 9th June 1989 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** Forth Diary Binary Packet Format - WOD **

A new binary dump format is now operating in the Diary cycle. The general
format of the packet is shown below:-

Sync 1 - 50H
Sync 2 - 41H
Frame Count MSW
Frame Count LSW

Data
Data
Data
Data 64 bytes of data

Data
etc.

Checksum MSW
Checksum LSW 16 bit binary addition of all bytes excluding Syncs.

As described last week this format is used for an engineering frame, and can also be used for Whole Orbit Data dumps. In the WOD mode each 64 bytes of data is part of a memory dump, with the address of each packet being given by the frame count. Each telemetry sample comprises 3 BCD digits which are packed as follows:-

| Byte 1 | Byte 2 | Byte 3 |
S1MSD S1LSD S2MSD S2LSD

where MSN and LSN are the most and least significant digits of samples S1 and S2. This pattern repeats for the whole memory, and cycles through the channels in the dump. The number and type of channels in the dump can be found from the engineering frame.

As a trial this format will be transmitted on Tuesdays, initially with Channel 53. The data will be transmitted between the DCE titles and Telemetry and will replace the conventional WOD dump.

* UO-9 elements from RGO *

MeanMo: 15.58793637
Decay : 0.00071304
RevNo : 42718

** AO-13 SCHEDULE **

Date : 14Jun89 until 16Aug89 ! 16Aug89 until 16Nov89
Attitude: 180/0 ! 210/0
Mode-B : MA 0 to MA 110 ! MA 3 to MA 160
Mode-JL : MA 110 to MA 145 ! MA 160 to MA 200
Mode-B : MA 145 to MA 255 ! MA 200 to MA 240
OFF : % ! MA 240 to MA 3
Mode-S : MA 150 to MA 160 ! MA 210 to MA 222

Also, for a trial period the OMNI-directional 70cm antenna will be connected to the Mode-B RCVR from MA 20 to MA 40. These changes have been introduced to enable stations who have access around perigee to experiment with perigee operation. Mode S unchanged. 14May89: BLON/BLAT 212.0/+2.4 with a drift rate of 0.016/-0.061 deg/day, respectively.

Transponders will be in operation during the whole orbit from June 14 until Aug 16 due to excellent sunangle and power budget. No perigee operation

between August and November due to perigee solar eclipses!

1215. Manual for SP-600

Newsgroup: rec.ham-radio
Date: 1989-06-11 13:47:52 UTC
From: wa2whv@ka2qhd.UUCP
Message-ID: <890@ka2qhd.UUCP>
Source record: 18337

I am looking for a manual, service manual, schematic(s) or whatever other information I can get on the HAMMARLUND Model SP-600 JX-17 receiver.

Please call (609)586-1129. I am willing to pay a reasonable price for these documents.

1216. Re: Reasonable foxing recievers...?

Newsgroup: rec.ham-radio
Date: 1989-06-11 14:53:43 UTC
From: john@anasaz.UUCP
Message-ID: <178@anasaz.UUCP>
Source record: 18338

In article <147990@Wayne-MTS> Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU writes:
]While working on my various fox-hunting projects, I find myself in the
]need of one or more reasonable priced FM and perhaps multi-mode recievers
]for automobile and sneakermobile use.

I use the Yaesu FRG-9600 VHF/UHF receiver. It isn't that cheap, but you
may find a used one. It covers AM, SSB, NBFM and WBFM from 60 to 902
MHz. It is extremely sensitive - on SSB I can hear clearly the smallest
signal my generator can put out (.1uV). It has a good S-meter even
though it is a digital LED type - it has a lot of segments, and
is quite insensitive - just what you want for a T-hunt. The S-meter
reads from about 1uV to 100,000uV (if you use the built-in attenuator).
The radio is in a metal case and seems to have reasonable shielding.

If you use a doppler system, you can run the 9600 in FM mode to find
AM signals (I use it to find 121.5 and 243.0 Emergency Locator Transmitters).

REVN 42718

** UoSAT-D News **

Harold Price, NK6K has been performing some performance tests on the UoSAT-D PCE, the Microsat CPU, and other machines. The results are summarised below.

Using a dhryston C benchmark from Sept. '86 DDJ p.88, here are some performance numbers (using a 6MHz AT as the index). The same compiler and options were used (/AS /Ze /Zp /Ot /Gs). /Gs (no stack checking) was used because the S/C stack check is different than the dos version. Normally /G1 (80186 instruction set) would be used for S/C programs.

The RIC is the PC card we're using for the simulator and for SW development.

Device CPU Clock dhrystons/sec index

Toshiba 3200 80286 12 MHz 3762 2.03
AT Clone 80286 8 MHz 2145 1.16
IBM AT 80286 6 MHz 1850 1.00
UoSAT PCE 80C186 7.3728 MHz 1398 + 0.75
RIC 80186 7.3728 MHz 1391 + 0.75
AMSAT proto V40 7.372 MHz 861 0.47
AMSAT flight V40 4.608 MHz 538* 0.29*
IBM PC 8088 4.77 MHz 1531 0.29

+ The timer resolution of 10ms gives an uncertainty of +/-14 counts,
these numbers are equivalent.

* calculated based on clock speed difference from wirewrap.

The RIC, Microsat Prototype, and UoSAT tests were done under the kernal, so
clock and scheduler overhead are included. Zero wait states were used.

Please use Bulletin ID UOSAT.261A if put on a packet radio BBS.

I have installed xbbs up on my machine for Ham Radio and Unix
users. It is in the testing phase now and I have made some
software available.
To gain access to this system call 733-1609 or 733-1630 24hrs a day
(1200-9600 baud Microcom 9624C) or 733-1696 bettween the hours of
8am and 5pm Mon-Fri only for Telebit 19200 baud.
To log into this system type bbs at the login prompt. The rest is
self prompting. For anyone wanting uucp access the uucp account is
bbsuucp without a password as well. I have permitted read access to
all public files and write access to /usr/spool/uucppublic.
Eventually I will have this on some form of packet radio as well
if I ever get my code up to speed. If you have any ham radio related
subjects or programs please send them in.

> who KNOW this stuff...
>
> 73s
>
> Mike

Mike, your memory is bang on! The Piccolo system does indeed only transmit one tone at time, and belongs to a class of modems known as MFSK or m-ary FSK. As you described, the tone frequencies are spaced at the minimum distance (f = 1/T, where T is the tone duration) at which the tone bursts are orthogonal in the frequency domain. These systems tend to be reliable (because of very slow baud rate, i.e., T >> multipath spread) but slow (bandwidth grows exponentially with bit rate). For example, the 32-tone Piccolo system uses T = 100 ms, so the throughput is only 50 bits/s. And since the tones are spaced only 10 Hz apart, frequency stability (or in practice, AFC) is a big concern too.

I think the original poster confused the MFSK modem with a _parallel_ modem, in which many FSK or PSK signals (again with orthogonal frequency spacing) are transmitted at the _same_ time... in other words, frequency-division multiplexing. In this case, T is typically around 10 ms, and the bandwidth grows linearly with bit rate. This is the most common method of getting bit rates > 300 bits/s on HF. The main drawback is low average power output because of the high peak-to-average ratio of the FDM signal, and T is not really long enough to prevent serious intersymbol interference when the multipath is severe.

Sorry to respond through the net, I could not reach you directly.

Fred,
I have a view of NYC from 438 miles up. I found it in a magazine quite some time ago. The caption says it was taken from a Landsat 4 satellite, with a Hughes thermatic mapper. Unfortunately, that's all it says. It's also kind of dark - there isn't much color in NYC. The water is nearly black, the buildings are gray, the beaches are white, and the parks are green. The 3 major airports are quite visible though. Good luck.

Excellent! That's an old fantasy of mine, and I'm glad there is someone
with the RC airplane experience to try it! Ultimately we might imagine
being able to pan and zoom the camera and sending altitude, attitude and
airspeed telemetry down to a computer for a completely virtual flying
experience! Do keep us posted on how it goes.

I have had this as a project on the back burner for severl years.
Recently DAK has advertised a Uniden mono camera and monitor combo for
$159. It uses 3 cond zip cord to connect the two and provide power.
I bought one and was not disappointed. It is very simple, fixed focus
and weighs 7 oz with the case. Taking it apart it gets smaller and
lighter (build into body of plane?!).

It runs on 12v (actuall I think it had a 5 volt regulator in it so it
may run on less). The monitor is very small and runs on 12 volts.

Drawbacks: The sensitivity and resolution are not great but it is
fine for well lit scenes. It is also only black and white. Well, for
$150 you can't expect too much.

I have talked to an RC friend and we may get together when I get a
transmitter. I plan on using the R7000 and this little 12v monitor to
recieve.

"The crux of the biscuit, is the apostrophe" -- This is the dog talking...

At the time of this posting, I had received 5 or fewer no votes. I had
received complaints from other voters that their votes had not come
through to me and another said he did not see my address on the original
call for votes. There is enthusiam for sci.commtech and it would be ashame
if interested voters didn't get through. Those interested in blocking
sci.commtech should know that my posting served as a catalyst for otherwise
disinterested readers recently sending in no votes due to this perceived
bias on my part. If you back and reread the discussion surrounding sci.
commtech, you will see what the objections were. You will also be able
to judge for yourself the support. I hesitate to do any more postings
until the voting is over. Bias was introduced by a poster very early in the
voting, and that bias came from a minority view. Usenet is a great way
to distribute information and personal expertise. I hope we can join.

1231. Solicitation package released for use of TDRS C-band (Forwarded)

Newsgroup: rec.ham-radio
Date: 1989-06-12 16:58:37 UTC
From: yee@trident.arc.nasa.gov
Message-ID: <26870@ames.arc.nasa.gov>
Source record: 18354
Cross-posted to: sci.space,rec.ham-radio

[Hope you hams find this useful. -PEY]

Dwayne C. Brown
Headquarters, Washington, D.C. June 12, 1989

RELEASE: 89-91

SOLICITATION PACKAGE RELEASED FOR USE OF TDRS C-BAND

NASA today released the solicitation package to organizations that have expressed interest in using the C-band capacity on two Tracking and Data Relay Satellites (TDRS) for international telecommunications purposes.

Eleven organizations have expressed interest in bidding for use of TDRS C-band services. The price of the C-band capacity will be established competitively. The deadline for bids is July 7, 1989.

Each satellite has twelve 36-Mhz C-Band transponders available. The agreement requires the user to purchase the capacity from all transponders on both satellites, located at 41 degrees west longitude and 171 degrees west longitude, for a period of 3 or 6 years. NASA's mission will have priority over the use of satellite system operations.

NASA will provide station-keeping control to 0.1 degree and operational tracking, telemetry and command for the spacecraft. The user will have responsibility for controlling and monitoring C-band transponder operations. Users must obtain all approvals required by law, regulation and/or international agreement prior to using the system.

Current NASA regulations, that provide for availability of TDRS services to non-U.S. government users, do not apply to C-band capacity.

The two TDRS spacecraft are part of NASA's new space-based network for tracking and communication with the Space Shuttle and other spacecraft in low-Earth orbit.

1233. Re: how to learn cw

Newsgroup: rec.ham-radio
Date: 1989-06-12 18:03:44 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <7880050@hpfcdc.HP.COM>
Source record: 18356

I recorded the W1AW sessions on a tape. I began by just recording the 5 and 7.5 wpm sections, then worked my way up from there. My goal was to eventually learn 13 wpm. The novice tape sent with "Tune In the World" gets pretty boring after a while, especially after you've memorized all the words they use. At least W1AW transmits different words every night. I also did some work with my computer on copying random call signs to practice the less frequently used letters - find a friend if you don't have a computer.

Don't listen to each dit and dah. Listen for rhythms. For example, "L" has a different rhythm from "F", even though they have the same number of dits and dahs. Eventually, whole words take on rhythms, like "the" and "RST". That's what the guys at >20 wpm do.

The particular rhythms are best internalized by each individual, since each sound may trigger different associations. "Shave and a haircut" may work for me, but not for someone else. The idea is that you don't have a lot of time to translate the sound and write it down, so try to find the association with the least amount of cognitive overhead. For example, "V" sounds like the first 4 notes in Beethoven's Fifth Symphony, and "V" is the Roman numeral for "Fifth". However, and higher speeds, this method of association gets cumbersome and actually makes me miss the next character, so there are limits.

Unfortunately, there is no substitute for practice.

1234. Re: Morse Code Woes

Newsgroup: rec.ham-radio
Date: 1989-06-12 18:14:16 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <7880051@hpfcdc.HP.COM>
Source record: 18357

You might be memorizing dits and dahs, and using visual techniques. Listen for the rhythms of each letter. Each letter should be sent at 13 wpm to hear the rhythm, and teach your brain to hear the rhythm instead of translating to dits and dahs with your mind's eye. My biggest problem was realizing that copying code was an audio-to-hand skill, and the less of my brain that was involved, the faster I could go. The extra step of translating the sound to a picture, then looking it up in my memorized table required too much thinking. Are you thinking too much ? :-)

Unfortunately, the only way to make the jump from individual characters to groups of characters (words) is to practice with words. Don't get discouraged - when I look at my old code practice sheets, I see the mistakes, but I also see the general upward trend in skill.

Hope this helps, and good luck.

>using were too boring and frustrating.

As an aside, I attended Carole Perry's talk at Dayton about teaching amateur radio to kids, and the code practice tape she uses has some sort of science-fiction story on it. As you can imagine, the kids can't wait to work through the whoe tape to hear the entire story!

Carole's package (lesson plans, code tape, and pocket-sized code practice oscillator) is called "Introduction to Amateur Radio." It's intended for use in schools (it ties into various curricula subjects), but I suspect it could be trimmed and adapted for use in a club-sponsored amateur radio class. It's billed as being suitable for ages 3-12. Does anyone out there have any direct experience with it?

I can send the ordering/inquiry info to anyone who's interested.

Patty

Disclaimer: I have no financial interest in Carole's package. I do have an interest in promoting amateur radio among kids. :-)

The story I heard continues with the fact that the announcer mentioned
above was executed for this. In fact, conditions in China have gotten
so bad that ANY media, including foreign media, are likely to be
injured or killed just for looking out their window. Don't be
surprised if the news reports get a little sketchy now.

Much as this method has a lot of superficial appeal, I think it has
a serious side-effect. When you get to any reasonable speed, the
mnemonics actually slow you down. I have great difficulty hearing
the letter Q without 'here comes the Queen', or F without 'filling
station' popping into my mind; the phrases are so long that by the
time I have cleared my brain, I have missed a couple of letters.

'Course, if you're planning on never using CW, or going for an extra ...:-)

>
> Does anyone know the status of AM stereo broadcast radio in:
>
> Canada
>
> Australia
>
As you are no doubt aware, in the USA, there are two surviving AM stereo systems, namely C-QUAM, and KAHN (ISB). While Leonard Kahn "invented" AM stereo in the 60's, and his system is receivable without any special equipment (Two AM radios one tuned slightly above, and one slightly below the center frequency), and on those receivers designed for it, the KAHN system is far technically superior, NONE THE LESS, C-QUAM, by more power in the marketplace has become the de-facto standard here in North America.

At mmy location here in Marquette Michigan, I can receive several distant AM STEREO stations, including one from ONTARIO, and it transmits in thee C-QUAM standard. I can not imagine the Canadian situation being any different than here. IF C-QUAM is not the official standard, it is the DE-FACTO standard.

In Australia, however, C-QUAM is the ONLY permitted AM STEREO system.

Having listened to C-QUAM and KAHN ISB, as well as the old MOTOROLA systems, My own trained ear prefers KAHN, although it is now virtually dead. The problem I have had with C-QUAM is what is called "platform motion" wherein the center image fades from left to right. And as a station gets weaker (as distant stations do, fading up and down) the system loses "lock" and the image goes in circles, very disconcerting through headphones.

I realize that few stations are concerned with distant audiences any more and economics dictates that anyone purchasing broadcasting or receiving equipment for AM stereo go with C-QUAM. Were I a media owner, I would (sadly) install C-QUAM.

From my reading, C-QUAM is the apparent winner world wide.

1243. Re: MARVIN call sign server

Newsgroup: rec.ham-radio

From: bowen@cs.Buffalo.EDU
Message-ID: <6495@cs.Buffalo.EDU>
Source record: 18370

I've had reports of problems with the callsign server, but I haven't had a chance to look into it much. And now with USENIX here, it looks like it'll be another week before I get to it. I'm not really sure what the problem is yet, but the server itself was actually written by an undergraduate student who has a habit of not checking return codes for functions! So that could have something to do with it.

When I get time (next weekend?) I'm planning a total rewrite with prompting, help and *maybe* even a search by string feature. I'll be announcing that here when it's done and I'll also be making the sources available for the server and maybe for a BSD client.

Sorry for any headaches this has caused for those that are having problems.

x
I've broken my self-imposed rule against getting radios
with tubes. I bought 2 older ham transmitters at a
recent hamfest and need information:

1. Johnson Invader - need schematic. This 58 pound
jewel was the top of Johnson line. It runs 200
watts on SSB, CW, and AM, and is VFO controlled.
The finals were a pair of 6146s. Circa about 1960.

2. Heath HX-11 - need manual and schematic. Intro-
duced in 1962, this simple cw novice rig was a
replacement for the DX-20. It is crystal contolled
and uses 6CL6, 6DQ6A, and 5U4GB tubes.

Yes, I know about the companies which sell manual photo-
copies, but I would rather get one free or trade some-
thing I have for the information.

Thanks in advance.

1246. SWL List subscription instructions

Newsgroup: rec.ham-radio
Date: 1989-06-13 14:12:34 UTC
From: kingdon@cunixc.cc.columbia.edu
Message-ID: <1585@cunixc.cc.columbia.edu>
Source record: 18376

ALL ARE INVITED TO JOIN A
>>>>>NEW SHORT WAVE LISTENERS ELECTRONIC MAILING LIST<<<<<

WHAT IS SWL-L?

Now there is a medium which SWLers can use to trade information on:

o Frequency lists (for all modes, all frequencies)
o Projects (homebrew, from simple to complex)
o Ask questions about:
o Monitoring
o Radios
o Antennas
o Listening conditions
o RFI
o etc.
o Learning!

I have been reading rec.ham-radio(.packet/INFO-HAMS) for 3 years.
While I have learned a great deal from reading this list, I feel it is
important to the SWLing community to have its "own place." There have been
some SWL related articles, which are welcomed by these Ham forums, yet I
have not found a dedicated SWL related information base.

Now, there exists such a medium here. There is a new listener's
group set up via LISTSERV here at Columbia University

Now SWLers can subscribe to a list which will be mailed to them
which will contain items of interest including, but not limited to the above
topic areas. You can receive frequencies FAST. How would you like to find
out the utility frequencies for an emergency situation within hours (not
days like it takes some Usenet messages to be sent and replied to via the
net, or MONTHS for magazines!). How about talking about projects you are
working on, antennas or radio problems? Many, many issues can be discussed.
I hope you will subscribe to the list, and if you do PLEASE POST!

HOW DO I GET ON THE LIST?

Just like any Bitnet listserver list you may subscribe to the SWL-L
list here at Columbia University.

INSTRUCTIONS:
1) if you're sending from a BITNET node, you can say:
(CMS) tell listserv at cuvmb subscribe swl-l your name here
(VMS) send listserv@cuvmb subscribe swl-l your name here

2) if you're sending from an internet site, or a UUCP site, do the
following:
a) send a letter to listserv@cuvmb.cc.columbia.edu -or-
rutgers!columbia!cuvmb.cc.columbia.edu!listserv
b) the first line of the body of the letter should read:
subscribe swl-l your names here.

3) You will receive a letter of confirmation. In this letter you
will find out more information about listservers and bitnet file servers.

4) To post to the list send mail to SWL-L@cuvmb with your subject
and letter. This letter will be echoed to all members of the List.

5) There is also a file server availiable. You may get a listing of
the files in the file server (currently there are none) by sending a command
to listserv (addressed in the same manner as you used to sign on the list).
The command will be the body of the letter. The command for a directory
listing is:
get swl-l filelist
You may request a specific file by sending a command (to listserv) which
says:
get filename filetype
as listed in the filelist.

REMEMBER!
----
send COMMANDS to Listserv@cuvmb
send LETTERS to SWL-L@cuvmb

Sign up and have fun!

1247. Re: Stick-on-glass antennas

Newsgroup: rec.ham-radio
Date: 1989-06-13 14:15:44 UTC
From: stu@tandem.Tandem.com
Message-ID: <442@tandem.Tandem.com>
Source record: 18284

As a follow on to the previou postings on stick-on-glass antennas....

Having installed several of this type of antenna, I hadn't anticipated
any problems installing one on my new vehicle.

After installation (and re-installation) I still cant get the swr below
1.9:1 on 440 Mhz (this is a single band 440 antenna).

Then I realized that *all* the windows are tinted (windshield has an area
of tint across the top - about 3" deep). I believe the tinting process
dramtically increases the metal content of the glass hence the problems.

So, add tinted glass to the reasons why not !

> ...No, I have not
> attempted the cellular mod to the second version, so I can not verify if
> it will still work.
> Ken WA6TTY...

I have attempted the cellular mod to the older version and
after two people ensuring that it met the usenet posted specs,
the scanner freaked. Perhaps a pointer to where the info resides
or another description would get us back on track.

Interesting to note the physical design changes; they will be
welcome, as will the electronic ones.

If you can find a small cavity to suck the offending signal
out of the coax you will definitely solve your problem!
Probably a last resort due to the size of cavities relative
to helical filters.

> Does anyone know the mods for the Yeasu FT212RH? Mainly to enable transmit
> out of the 140-150Mhz band?

No, I sold the radio when I could not get it to do this. Yeasu was very unhelpful the entire time. "No, we will not discuss out of band, good bye, click."

Things I learned:

CPU reset: short the cathode of D09 to ground to reset.

Expand Rx Freq after reset: turn of, hold 2 buttons down (don't remember which ones), turn on.

I went thru all the combinations of the solder pads. The CPU did some neat things, 2m, 220, 440, 1.2g, but the radio only got more restrictive for Rx and TX.

My radio also had a "crackle" which was evidenced during normal driving down the road. It sounded like a bad antenna conection or power problem. It wasn't. It was in the fromt processor board and I never got rid of it.

The only redeeming thing this radio had was the auto-dialer mike. I had the "answering-machine" module. It worked, but the user interface made it unusable in normal use.

My advice: Sell it and buy the ICOM-228. It does everything correctly except the scan speed should go faster and it needs an auto-dialer mike.

> If you know where to find stuff like this on the surplus market, let me
> know. I just love homebrewing.

While your project is admirable, buying surplus oil filled capactiors
on the surplus market is a Generally Very Bad Thing. This is because these
capacitors invariably are a PCB Contaminated Article. **ANY** capacitor which
is askarel-impregnated (which means virtually all of the sold before 1980 or so)
must **not** be resold.

The resale of such capacitors is a favourite trick of broadcast stations
and other users to "dispose" of these capacitors improperly. Disposal or use of
these items can ultimately tie you into SIX FIGURE FINES.

Gentlemen, do yourselves a favour. Do **not** under any circumstances
buy surplus capacitors (or oil filled transformers, or whatever) for your ham
rig unless you are absolutely, positively CERTAIN that the device is NOT contaminated
with PCB's. The EPA is deadly serious about this, and the worst thing that the
FCC does to anybody is a picnic compared to EPA fines and penalties.

Buy **new** capacitors for this project. They are not that expensive,
and you'll be certain that you are not dealing with PCB contaiminated
articles.

It won't work from TAC's either, probably, for I guess
that the server is not really a TELNET server. The BSD
telnet client if it doesn't receive an answer for it's
option negotiation assumes that the other end is dumb
and uses local line mode (editing and echo). TAC's and
other less forgiving telnet clinets will just sit there
and beep or hang on you.

Subject: to-x5at mods

I tried about 20 different ways to get to you from here, but none of the
addresses would work. You can't get to Univ of Western Ontario from
Michigan State Univ! Therefore, I'm posting. (How in the world did you
mail to me? If I can't get to you, then how come . . .)

I did the mods on my ht, and the ht will now rx over a wide range. However,
it still tx only in ham band. Is there something you left out in your
description?

I don't think I left anything out. I did some of these mods to my radio
about a year ago, and I wrote down how the radio acted with various
pull-up/pull-down resistors inserted or removed. What I put in the
message was what I had written down in my manual. It worked on my rig.
I think the mod you want is both R22 and R28 out. I can't remember if
any other pull-up/pull-down resistors had any effect, but if any of them
did, it would probably be R23 and/or R24. You can't hurt your radio by
taking these parts in and out (except maybe by leaving the heat from a
soldering iron on a board too long). Go ahead and try out a few things;
if I have made a mistake, please post a correction to the net.

NOTE: removing the knobs on the top of the radi allow you to get at the
micro board without un-soldering.

>with propagation conditions. The signal consists of very short pulses,
>about 50 per minute. The pulse spacing seems to be very regular...
^^^^^^^^^^^^^

The pulse rate suggests an electric fence. It could be a mile or more
away. Drive around the area, listening for it on the AM broadcast band.

> The pulses can be heard ANYWHERE between about 2 to 30 Mhz...

An electric fence is a long antenna connected to high-voltage impulses
from a car ignition coil or similar transformer. Impulses really are
on all frequencies, just like the theory says.

>The signal seems to appear around mid-morning and goes away sometime
>after mid-night local time.

Most electric fences run 24 hours; maybe it's solar powered, on a
timer, or maybe the owner moves his animals periodically. If the
offender is an electric fence, the signal strength should decrease
during wet weather. If it's not an electric fence, look for some
thermostatic device like a heat tape or fish-tank heater.

Hi:

I was having trouble getting into the MARVIN and KA9Q callsign servers via Telnet (as several other folks were). I would try to connect with port 2000 but nothing would happen. I found that the "(LINEMODE" option solved my problems on both servers. Here's a sample connect:

TELNET 128.205.32.4 2000 (linemode

I hope this helps some of you. ...Chris...

Several people in this chain have mentioned the Gordon West Morse Code tapes. Can someone tell me (either here or via email) where I can get this tapes (quickly, if possible)? Thanks in advance.

1261. 2M T-hunt South San Francisco Bay Area, This Sat

Newsgroup: rec.ham-radio
Date: 1989-06-14 04:40:21 UTC
From: bmp@hpcupt1.HP.COM
Message-ID: <7120071@hpcupt1.HP.COM>
Source record: 18279

Just a brief note.
For those who are based in the Southern Portion of the San Francisco
Bay Area (Silicon Valley), our monthly amateur radio Transmitter Hunts
are continuing this season. We have shifted them to Saturday evening
from Saturday mornings on the 3rd Saturday of the month.

The next one takes place this Saturday the 17th at 7:00 p.m.
and runs until everyone completes or the huntmaster gets tired.

The start location is 1/4 mile past the bridge on Cristo Rey Drive
off Foothill Avenue in Cupertino. Look for the cars with silly
looking protrusions. Talk in 145.27-,224.360-.

We announce upcoming T-hunts on the SPECS and SVECS nets.

This is a mileage only hunt, to find the huntmaster
who will broadcast on a 2-meter simplex frequency.

All are welcome.

Send mail for more info or come up on 223.640- and ask anyone
there for more info, we can probably supply more details.

>... Disposal or use of
>these items can ultimately tie you into SIX FIGURE FINES.

>... The EPA is deadly serious about this, and the worst thing that the
>FCC does to anybody is a picnic compared to EPA fines and penalties.

I have a story that relates to this, and a question. I had a Heathkit "CanTenna", which was a 1 gallon can with a carbon resistor in it, which you filled with oil. I got the can filled in the mid 60's by a fellow who worked for So. California Edison -- i.e.: transformer oil -- which almost certainly had PCBs in it. Now the fun part: how do you dispose of such a thing?

The local town has a "toxics cleanup" day, by which they mean paint, gasoline, insecticide, etc. They will NOT take PCBs. Calling EPA revealed that there is only one legal way to dispose of PCB contaminated stuff: put it in a 55! gallon drum, and have it hauled by a registered transporter of hazardous materials to a registered disposal facility. Guess how much that is likely to cost. Oh, by the way, at the time I checked there were NO registered disposal facilities in the USA.

And, of course, it is illegal to keep the stuff.

So, the question is, if you can't keep it and you can't give it away, how do you get rid of it? I volunteered to drop it off at the local EPA office, but they didn't want it.

Marc Kaufman (kaufman@polya.stanford.edu)

... but that oil has a wonderfully high dielectric constant...

1263. Re: W1AW Schedule

Newsgroup: rec.ham-radio
Date: 1989-06-14 13:20:07 UTC
From: dvh@cci632.UUCP
Message-ID: <29200@cci632.UUCP>
Source record: 18285

Here is the current W1AW code practice schedule, from QST for June,

1989, page 83:

SLOW code practice-

Monday, Wednesday, Friday at 0200, 1300, 2300Z (GMT)
Tuesday, Thursday, Saturday, Sunday at 2000Z
Sunday at 0200Z

FAST code practice-

Monday, Wednesday, Friday at 2000Z
Tuesday, Thursday at 0200, 1300Z
Tuesday, Thursday, Saturday, Sunday at 2300Z
Saturday at 0200Z

Note: SLOW code is at 5, 7-1/2, 10, 13, and 15 WPM
FAST code is at 35, 30, 25, 20, 15, 13, and 10 WPM
code is sent in the speed sequences listed here (i.e. 7-1/2 is after
5 and before 10)

Frequencies of bulletins and code preactice: 1.818, 3.58, 7.08, 14.07,
21.08, 28.08, 50.08, and 147.555 MHz. Note: these are NOMINAL freqs-
they may not be exactly there when you go to listen, but if you are there
early, the transmissions are usually prompt and begin with "QST QST QST
DE W1AW W1AW W1AW" sent very slowly a number of times so you can find them.

Also, text for code practice is taken from QST, so if you have access to
the magazine you can check your copy- they tell you which issue and pages
the text comes from at the beginning of each session.

Hope this helps.

You might call up the power company and explain your predicament
to them. For one gallon of oil, they might be willing to add it
to the mess that they must already be accumulating.

By the way, the danger of PCB's is *VASTLY* overrated.

-Ron

From: copper@bgsuvax.UUCP
Message-ID: <4250@bgsuvax.UUCP>
Source record: 18288
Cross-posted to: comp.sys.ibm.pc,rec.ham-radio

I have been asked to investigate the possibility of implementing a Usenet host on a pc or pc look-alike. If you are reading this on a pc, then you've already solved the problem (unless you're just using the pc as a terminal)!

I've cross-posted this to the ham radio group because I know many hams are using pc to receive their news, and so I call on their expertise as well.

Ideally, I would like to find software that would allow a pc running MS-DOS to contact a Usenet site, transfer appropriate news items (as well as uucp mail), and allow me to read and post articles.

I know that pc-UN*X systems are available that will accomplish all this, but I don't believe that pc-UN*X is an option here.

Any help would be appreciated. Please reply directly to me, or if you would like a copy of the results I get, drop me some email, and I'll send you a copy of all my replies.

Thanks,

Maybe you congressman can help you out. Seriously. And maybe if he/she
isn't interested, you could seal it up carefully, label it, and mail it
to him/her anonymously :-). If all you say is true, it sounds a lot like
bureaucracy to me. Sounds like everyone was part of the problem and nobody
was part of the solution. If you really want to get something done (like
rid the world of PCB's), ya gotta make it _easy_ to do. Otherwise, good,
honest folk will ignore you - to say nothing of what the rest of us will do!

Actually, "invariably" isn't quite the right word here. I recently bought an oil-filled cap from the surplus counter at a local Seattle electronics store that is _clearly_ labeled "NO PCB". It was manufactured in 1983, as I recall. But I agree that it would be good to stay away from ones that aren't clearly labeled as having no PCBs.

Recently someone asked for the TH215 mods........

Date: 2 May 88 15:22:00 GMT
Posted by: silver!commgrp@iuvax.cs.indiana.edu
Subject: Kenwood TH-215A modification

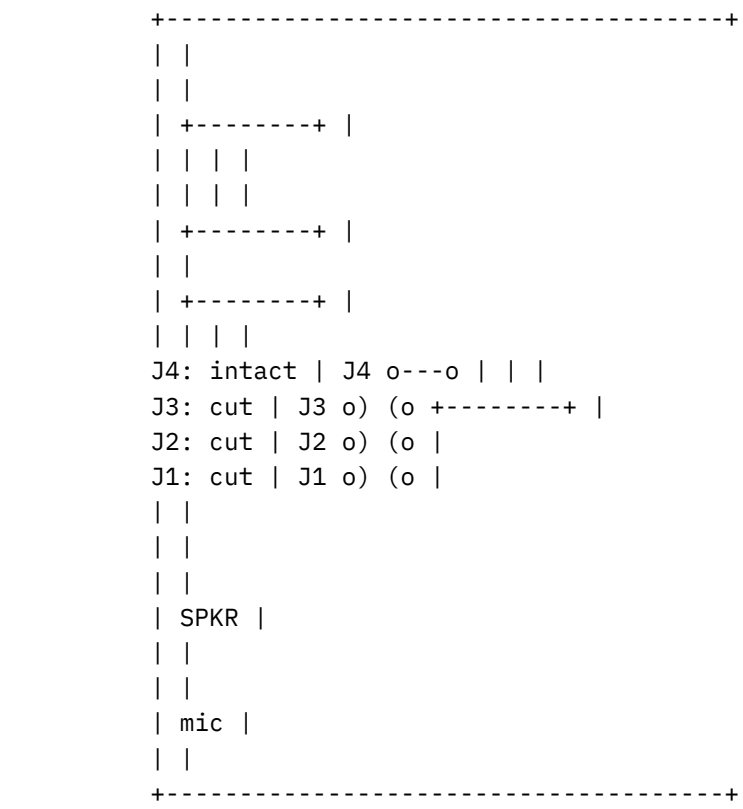
KENWOOD TH-215A handheld transceiver out-of-band modification:

1. Remove two screws from belt clip

2. Remove 4 screws from back of radio

3. Slide front assembly off

4. Locate set of 4 jumpers:



5. Reassemble radio.

6. Reset microprocessor: Turn radio on while simultaneously pressing
both _F_ key and _ENTER_ key.

--

DISCLAIMER: I do not own a TH-215A and have not verified the above information. Hopefully, the modified frequency range includes 162 MHz weather-broadcast freqs. Remember, it is ILLEGAL to transmit outside the ham band with non-FCC-type-accepted equipment, even if you are licensed to use such frequencies.

Yukon Quest equipment proposal JUN 14, 1989 1

Equipment Proposal
by
Jim Dixon, NL7HI
Louis Tozzi, AL7IF

The equipment that was used for communications during the 1989 Yukon Quest may not necessarily be available in the 1990 race. It may be necessary to look into the donation of equipment and raise money for equipment to assure the same quality of service provided for the 1990 race that was provided for the 1989 race.

Order in which to acquire equipment

1a. Look for manufacturer donations
1b. Look for donors to underwrite the expense
1c. Look for local dealer for donations
2. Raise money for equipment
3. Ask other amateurs for donations of equipment
4. Spend money raised for another purpose
4. Do not acquire equipment

Yukon Quest equipment proposal JUN 14, 1989 2

Base Station

Required equipment:

Item	Cost	List Price
Kenwood TM 621A 144/220 radio	$630	$730

Phil,

I also find it distressing that they don't give the no-code licensees all of the 2m privileges that go to Technicians. The idea of this hobby is to get in and trade ideas. This is hard to do when one is sequestered out of an area.

Mike

When I took my 5 wpm test, there was no Farnsworth shift on it. I missed the first callsign before I got used to the rhythm of "straight" code. Apparently, the code can be either type, and is at the discretion of the VEC. When I took the 13 wpm test two months later, it was also "straight", just like the W1AW transmissions.

Perry, KF0CA

Ok, if I want to actually buy this stuff new, where do I go, and how much money do I take along ?

I hadn't thought of PCB's - thanks for the warning. And yes, the dangers from the EPA probably outweigh the dangers of the PCB. :-)

Perry

By the way, this was originally in the rec.ham.forsale group to comply with ARPA's rigamorole, so please follow up there.

TAPR DISSATISFIED WITH NORD><LINK'S RESPONSE TO TheNet ALLEGATIONS

In light of NORD><LINK's response to allegations that TheNet is a direct copy of NET/ROM, the Board of Directors of Tucson Amateur Packet Radio (TAPR) has asked NORD><LINK, the purveyors of TheNet, to return the Network Node Controller (NNC) software development system that TAPR had provided to NORD><LINK.

At TAPR's annual Board of Directors meeting in February, Ron Raikes, WA8DED, the codesmith of NET/ROM, argued that TheNet firmware was a copy of NET/ROM. To support his allegations, Ron presented an independent analysis by Thomas Allen, WA6IGY, that substantiated WA8DED's claim (see Gateway, Volume 5, Number 11). After hearing Ron's presentation, the TAPR Board asked NORD><LINK to respond to the issues raised in WA6IGY's evaluation.

NORD><LINK's response was received recently and after evaluating it, the TAPR Board of Directors concluded that NORD><LINK did not adequately address the issues raised and, as a result, the Board has asked NORD><LINK to return the NNC software development system. According to TAPR president Andy Freeborn, N0CCZ, "The principle question raised appears in the WA6IGY conclusions (last paragraph) which states `...that TheNet is not an original development but rather a direct copy of NET/ROM.' It was the response to this allegation that the TAPR board sought. It was the reply to this allegation that did not satisfy the board."

COMING BITS

NAPRA Packet Networking Forum

The Northwest Amateur Packet Radio Association (NAPRA) will hold the 1st Northwest Packet Networking Forum on Saturday, July 15 in the Seattle area. The purpose is to discuss ways to improve the network's operation and architecture today, tomorrow, and far into the future (see Gateway, Volume 5, Number 14, for more information concerning the forum's format).

The forum will be held at the Boeing Recreation Center, Room D, 22649 83rd Ave S, Kent, Washington. Doors open at 9 AM (coffee and donuts will be available) and the forum starts at 10 AM. Talk-in assistance may be

obtained on the 145.33-MHz repeater. The meeting room is equipped with a PA system and an overhead projector. Please contact NAPRA if any special assistance is needed. The point of contact in NAPRA is Dennis Goodwin, KB7DZ, via mail: Apt #M4, 1748 Harrison Ave SE, Port Orchard, WA 98366; via telephone: 206-871-5818; via packet radio: KB7DZ @ KD7NM.

from Tad Cook, KT7H @ WS7M

Dataspace T89

This year's RSGB Data Symposium and AMSAT-UK Colloquium have been combined into Dataspace T89 and will be held July 27-31 at the University of Surrey in the United Kingdom. The International Space Assembly is scheduled for Thursday, July 27; the RSGB Data Symposium for Friday, July 28; the Combined Dataspace Tryst for Saturday, July 29; the AMSAT-UK Space Colloquium for Sunday, July 30; and the Satellites-in-Education Colloquium for Monday, July 31. All meetings will begin at 10 AM and end at approximately 6 PM.

In addition to the lecture program, there will be demonstrations of space and data communications equipment, RSGB bookshop and membership services, AMSAT-UK bookshop and services, two amateur stations (GB2SAT on HF and GB0AUK on satellite), tours of the UoSAT command station (on Friday and t
Saturday evenings), and weather and television satellite demonstrations. Further information and booking forms are available from Ron Broadbent, G3AAJ, AMSAT-UK, London E12 5EQ, UK or RSGB Headquarters, Lambda House, Cranborne Road, Potters Bar EN6 3JW, UK.

FAST PACKET RADIO SYSTEMS

For some time now, I have been interested in the discussions going on regarding fast packet radio and data links using RF modems, specifically 9600-bit/s modems. There seem to be two schools of thought:

1) To use modems connected directly to transceiver IF strips and modulate the carrier directly with data.

2) To connect the data modem via the audio connections of the transceiver and operate in a similar way to the technique used on 3- kHz bandwidth telephone lines. A colleague of mine, J.T. Sandys, G8DXZ, and myself have proved that this technique works up to 9600 bit/s and we plan to try 14,400-bit/s modems soon.

The purpose of this article is to discuss the latter technique and (hopefully) stimulate some interest and maybe even some more experiments with these modems.

The Principles

Telephone modems, because of the transmission medium, must operate within a 3-kHz bandwidth. The frequency response of the telephone line is normally

quoted as being between 400 Hz and 3400 Hz. Most people are familiar with normal frequency-shift keying (FSK) using two different tones as used in existing packet radio equipment, but to go much faster than 1200 bit/s within a 3-kHz bandwidth requires some further thought.

The first principle used is phase-shift keying (PSK) which uses one audio tone (the carrier) with phase changes introduced into this carrier which can be detected at the receiver. The advantage here is that one phase change can theoretically be introduced every cycle of the carrier and, if four types of phase changes are used, then two bits can be encoded per sampling time.

Secondly, amplitude changes can be added resulting in more combinations and more bits encoded per sample time. At this stage, we should introduce another piece of jargon, the baud. Baud is defined as the sampling time, ie the rate of phase and amplitude changes, for example, if four bits are encoded during every baud, and the baud rate is 1200, then the effective bit rate will be 4800 bit/s.

Given below is a table showing some half-duplex modulation techniques and their data rates.

Technique Bit Baud Bits Phase Amplitude Carrier
Rate Rate Per Changes Changes Frequency
Baud

V.29 9600 2400 4 8 1 1700
V.29 7200 2400 3 8 0 1700
V.29 4800 2400 2 4 0 1700
V.27 4800 1600 3 8 0 1800
V.27 2400 1600 2 4 0 1800

Another aspect of these modems is that of training. When data are sent, they are scrambled to make sure that all of the data points are sent even with no data being sent. This makes most efficient use of the transmitted spectrum. The receiving modem will synchronize to the transmitting modem, keeping track of the phase changes as the transmission goes on. This training does take some time however, and will cause time overhead if the channel is turned around frequently. The main reason for training using these patterns is to determine the phase and amplitude restrictions of the path and to set up an equalizer that is used to give a flat response during data transmission. The modems we have tried also employ adaptive equalization which will adjust equalizer values during data transmission for small changes in the quality of the received signal.

The time taken to train may make transmissions using this faster data mode an overhead rather than an advantage if only small packets of data are sent. V.29, for example, needs 270 milliseconds (ms) to train before any data are sent, which is equivalent to about 40 characters of information at 1200 bit/s, therefore, we should send at least this amount of data and preferably more to take advantage of the higher data rate after training.

Below are some packet sizes and the times to transmit them using existing 1200 bit/s packet radio versus V.29 at 9600 bit/s.

Packet Size (chars)	Time @ 1200 bit/s	Time @ V.29/9600 bit/s
20	0.133	0.286
50	0.333	0.311
100	0.666	0.353
200	1.333	0.436
500	3.333	0.686
1000	6.666	1.103
2000	13.333	1.936

(Times are given is seconds.)

From the table it can be seen that the larger the packet, the greater the advantage. It may be that this mode of transmission is not suitable for use with the existing AX.25 standard, but some sort of alternative protocol could be used (or developed) which will not transmit until it has a certain amount of data to send. (Further discussion about protocols is beyond the scope of this article.)

Remember that these modems are designed to operate within the 3-kHz available on telephone lines and a larger audio bandwidth is normally used on VHF/UHF FM, so the quality on a good path is usually found to be better than that obtained via the telephone system.

The Practice

There are a number of modem devices which can be used for the audio modulation part of a fast RF modem. Connection to a rig can be simple via audio in, audio out and PTT and these modems should be simple to connect to existing TNCs, but I have not tried this yet. So far, I have tried communications using an IBM PC directly controlling the modem and PTT without any rigid packet radio structure as such, but this has proved that the principle at least works on VHF/UHF FM.

All of the modems I have tried have been similar in that they require computer control via a bus which is 8080 microcomputer compatible and have simple audio in and out connections. All that is needed is a dc blocking capacitor between the modem output and the microphone input (some transceivers may also need some attenuation of the signal) and a capacitor from the earphone output of a typical transceiver. A relay should then be driven to control the PTT.

Suitable modems I have tried include the following.

The R96MD, which is a V.29 and V.27 modem primarily intended for FAX machines, but it makes an ideal half-duplex data modem. This device is supplied on a small printed circuit board with two rows of pins allowing it to be assembled like a large DIP device. It will operate from 9600 bit/s down to 2400 bit/s, as well as at V.21 at 300 bit/s FSK. DTMF is also provided which may be of use to some amateurs. Because of its application

in FAX products, this modem benefits from a reduced cost due to its use in massive volumes.

The R96MFX and R96EFX, which are CMOS single-chip modems with similar features to the R96MD. The R96EFX is especially interesting because it has a V.27 short train feature, training in 50 ms instead of the standard 270 ms, and HDLC packetizing and error detection built-in, thus avoiding the need for external HDLC controllers.

We soon plan to try the R144HD, which is a V.33 modem that operates at 14,400 bit/s. Again, the modem is designed to operate in a 3-kHz telephone bandwidth, so VHF/UHF operation should not be a problem.

If you would further information, you can leave messages for me at GB3UP (G1NTX @ GB3UP.GBR.EU).

Reference reading:

"Quality of Received Data for Signal Processor Based Modems", application note, Rockwell 1987 Modem Data Book. This data book also includes data sheets on all of the modems discussed.

Rockwell Interface Guide. This provides detailed information as to the connection, use and monitoring techniques used for these modems.

RESPONSE TO HERESY

Whether he meant it or not, WB4APR's message in Gateway, Volume 5, Number 15, has some deeper sides to it. First of all, the limit of the number of messages of importance approaches zero as the number of messages approaches infinity: this has always been and will probably always be true in our hobby. How many times have you listened to a conversation on SSB about the merits of dipoles versus verticals? The exception, of course, are those very important error-free emergency messages.

At the same time, with packet radio, the media is the message. We are all having just too much fun experimenting, and this is great. And finally, perhaps we should not kill the messenger - packet radio. What is really required is just a little more discipline on the part of the users, designers and manufacturers to improve level 1, operating habits, etc. And just as valid today as yesterday is Digi-Pete's concept of packet radio poop.

by Phil Anderson, W0XI

[Your Gateway editor met Phil at the Kantronics booth at the Dayton HamVention this year, where he was showing off the new Kantronics TM-1200 Telemetry Modem, which is another real world application of our packet radio hobby. The TM-1200 combines Kantronics' commercial packet radio modem with a traditional remote terminal unit (RTU) and is used to transfer

data, such as temperature, pressure, water levels, etc, between remote locations, where the data is collected, and a central site via packet radio.]

STRAY BITS

According to David Toth, VE3GYQ, W0RLI PBBS Version 10.06 has been released. According to AMSAT, the MicroSats' launch has been "pushed-back" and is now scheduled for November 9. And according to the Microsoft Word line counter, this is the end.

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail to:

Gateway
Stan Horzepa, WA1LOU
75 Kreger Drive
Wolcott, CT 06716-2702

or electronically, via CompuServe to user ID 70645,247. Via telephone, your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s.

The deadline for each issue of Gateway is the Saturday preceding the issue date (which is typically a Friday).

Cross-posted to: rec.ham-radio,sci.electronics

I have two scanners here. They are the Radio Shack PRO-2004 (300 channel) and PRO-2021 (200 channel) scanners. A few weeks ago I saw several modifications for the PRO-2004. One was for extra channels, the other for getting extra frequencies that the scanner could get. Can someone resend these to me please.

I also want to know if anyone has any modifications for the PRO-2021 scanner. If so, please send these also.

Thanks, Ed

> for So. California Edison -- i.e.: transformer oil -- which almost certainly
> had PCBs in it. Now the fun part: how do you dispose of such a thing?
>
> And, of course, it is illegal to keep the stuff.

It is NOT unlawful to keep or utilize any product containing PCB's
which was manufactured or otherwise obtained prior to the "grandfather"
dates of any applicable EPA (federal) or Dept. of Environmental Conservation
(or equivalent title for your state) legislation. Most applicable legislation
is actually performed on a state rather than federal basis.

In many states, capacitors or other components containing less than
SIX POUNDS of PCB's are exempt from ANY regulation, except when found in
agregate quantities of some hundreds of pounds.

I am not trying to encourage the indiscriminate use of PCB's through
the above statements, but I am trying to dispell some "knee-jerk" statements
resulting from overreaction to the mention of "PCB's".

> So, the question is, if you can't keep it and you can't give it away, how do
> you get rid of it?

You either pay a ridiculous amount to a regulated transporter for
the disposal of the material, or you keep it in a "safe" place. The
PCB Police are not about to knock at your door. Chances are that you
have an exempt quantity, anyhow. There are regulations for what constitutes
"safe" storage of PCB-containing items, but these regulations pertain only
to large quantities, and you wouldn't want to hear about them anyhow.

1279. HyperCard Stack for "Novice Ham Test"

Newsgroup: rec.ham-radio
Date: 1989-06-15 12:34:59 UTC
From: dls@genrad.com
Message-ID: <22288@genrad.UUCP>
Source record: 18309

As I mentioned in an earlier posting about a month ago, I have created a HyperCard stack for an interactive Novice Ham Test, which contains all 302 questions of the question pool. It is free to anyone who desires it, simply by sending my a 800K diskette and a self addressed stamped envelope. Note that HyperCard only runs on Macintoshes, NOT IBM pcs.

Thanks to one of the respondees, I have discovered a minor flaw in the stack. I wrote it using HyperCard version 1.2, and it will not work with earlier versions of HyperCard (1.1 or 1.0). I'll see about converting it so it runs on version 1.1 (I don't have a 1.0 version of HyperCard, so I can't test that). Meanwhile, I've placed in the stack script a check to make sure that it is version 1.2. Symptoms of trying to use this stack on earlier HyperCard versions include a message saying that the stack is "locked" and cannot be read.

For those of you who have the stack, let me know if you detect any other errors, and I'll fix them.

1285. AutoLog: Computer control of ICOM radios with Logging (UPDATE)

Newsgroup: rec.ham-radio
Date: 1989-06-15 20:25:23 UTC
From: rbono@necis.UUCP
Message-ID: <1071@necis.UUCP>
Source record: 18301

A new version of AutoLog has been sent to Keith to be
placed into the SIMTEL archive server. AutoLog allows the control
of an ICOM radio for *ANY* ICOM radio that supports the ICOM "CI-V" bus.
AutoLog allows your computer to become an "extention" of the front panel
of your radio. Frequency, mode, memory channels, etc. may be controled
either from the Radio, or from the Computer. Logging is handled and
provides "instant" updates to previous contacts of the current station.
All contacts are kept in RAM for *FAST* operation. 640K system ram will
allow more than 5,000 contacts per log file. The program will also
calculate greate circle short and long path distances for DXCC-prefix
countries.

This version is for the IBM and compatibles using DOS version 3.0
or newer.

Most of the changes to this version are to make operation of the
program smoother. A "configuration" program and function is now supported
to help users configure the system. There are no major new features over
previous versions (this is version 0.4).

This program is considered "shareware", but my "trial" period does
NOT specify any length of time. NON-profit shareing of this program is
encouraged. No-Source code is available.

If anyone is working with this (or the previous version) I would
like feedback on how you like it. Many have told me that they are using
it, but I have not received *any* bug reports (and I don't beleive that
anyone can write *bug free* code!) ;-)...

1286. UNIX -> ham radio -> unix connections

Newsgroup: rec.ham-radio
Date: 1989-06-15 22:45:54 UTC
From: lance@hermix.UUCP
Message-ID: <294@hermix.UUCP>
Source record: 18306
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Again I am asking for any information you can give me. Sofar I have
not gotten ONE response.

Someone out there has to be doing this!!

I have a SCO Xenix box at home and work. I want to tie them together
via radio. I would like to get at least 2400 Baud out of it.
It does not have to be packet (direct two-way connect is ok, but it
HAS to be bi-directional at ALL times).

Has anyone done this? Can someone help me? ANy ideas on who I should
contact? What would it cost? Etc.

Thanks,

The current plan, for my part, anyway, is to order the new info
sometime between now and August. If the delay is anything like
it was last time, it will be a month or 2 before I can start getting
tapes out. (lets hope they don't have another delay like last
time and it only takes 2 weeks...)

How many of you who went for the first database set want the
update, if its $10 + media? Please make this a 'pretty sure'
yes if you reply 'yes', as this will influence my decision.
(If you want the database *now* (or have within the last 2 weeks
gotten a copy of it, which I think is one person), but also want
the update when it comes out, talk to me.
If you were not in on the original group, and want to
get the database this time around, email me and I'll send details.)

And, if I have not replied to anyone who recently sent email, please
do not be offended, my machine was recently 'upgraded' to OS4, and
I may have lost your message. Please send it again. Thanks.

And, while I'm at it, whats the best way to make the update?
some kind of context diff? or a context diff in a sed script? ???

The source for them recently changed if you want to order direct. You
can probably find them advertised in any ham magazine. AES in Las Vegas
carries the sets: Novice, General, and Extra. It use to be a little
cheaper to order them directly.

Also, I think the actual name is "Radio School." Gordon West is the
person who recorded them.

My personal experience was that I just used the phrases to get a feel for
the rythm of the letters, not really as a mnemonic. I only used them
for a short time (a week or two) before going directly from code to
the letter. I didn't notice any problem as I increased up to 13 wpm
or now while I am working on 20 wpm.

Btw, the wife of a friend was having trouble until she wrote out the
letters in musical notation. She was a musician and that format
"clicked" for her.

I have heard the same pulse QRM, but did not pay attention to the times and, although I have heard it on many points on the HF band haven't really taken any data, but now that it's mentioned I will and if I hear any more, will report on it.

QTH is Hamilton Square, N.J. Just outside Trenton, N.J.

>being able to pan and zoom the camera and sending altitude, attitude and
>airspeed telemetry down to a computer for a completely virtual flying
>experience! Do keep us posted on how it goes.

Its a fantasy of mine too, but I have played with enough RC planes to spot a couple of problems. Number 1 is the extremely severe vibration that anything mounted in an RC plane gets. I have seen estimates of 150Gs!

I would suspect that you would need some very careful isolation mounts as well as a very rugged camera. Even so the picture would probably only be useable with the engine idling.

The other major problems are: RFI to the RC receiver - low power and the need for a UHF link should solve most of this, but you might have to wrap foil around the servo leads.
You will need one to fly and one to look unless it is a VERY stable airplane - I would suggest a Telemaster. Big slow and stable!
The expense of a crash/fly away gets pretty steep too, but with some experience this shouldn't be too big a risk.

As for the legal aspects, provded you don't use it for spying or snooping on anything secret (military bases etc.) I can't think of any problems.
Check QST for ATV gear ads.

And DO keep us all posted - it sounds like a great idea!

>I used to have a Hygain TH6DXX and now have a KLM34XA. The Hygain
>was much better mechanically than the KLM.
>I never had a bit of trouble with my TH6 and
>neither did numerous friends who owned them.

I bought my TH6 used 12 years ago in Florida (can you say hot salt spray!),
it was around 10 years old then. Since then it has done 2 years in Mass.,
and 8 years on the Arizona sun. The only problem in all that time was
replacing a couple of U bolts with stainless ones and ALL the steel nuts
with stainless steel.

I would recommend it wholeheartedly to anyone.

The disadvantage: it is BIG - 75lb and 24 ft boom. You will need 2 men to
get it mounted even on a tilt over tower. That is the same for any beam in
this class though. The SWR on the TH6 was somewhat high at band edges, but
no problem for tube finals (TS820/linear). Max 2.5:1 approx.

I weather proofed it with Mosely "Antenna Gaurd" which seemed to reduce
the pitting of the aluminum in Fla.

And what the EPA does to you is NOTHING compared to what the PCB can do to you if it gets into your system! In a world with so many dumb laws and regulations this one stands out as being for REAL. PCBs are DEADLY - DON'T fool with them in ANY way.

If you have some equipment that might contain PCBs then don't just toss it in the trash either - its a pain (and expensive) to dispose of properly but there is good reason behind all the fuss.

I guess this is a good time to remind everyone that some surplus equipment (esp. WW II) was wired with explosive devices intended to destroy them before they were captured by an enemy. The devices look a lot like the old metal "bathtub" capacitors, but have the explosive power of a stick of dynamyte if voltage is applied! Again be SURE of what the thing is FIRST!

The explosive devices were supposed to have been removed before disposal to the public, but there are at least a dozen cases where hams had them explode.

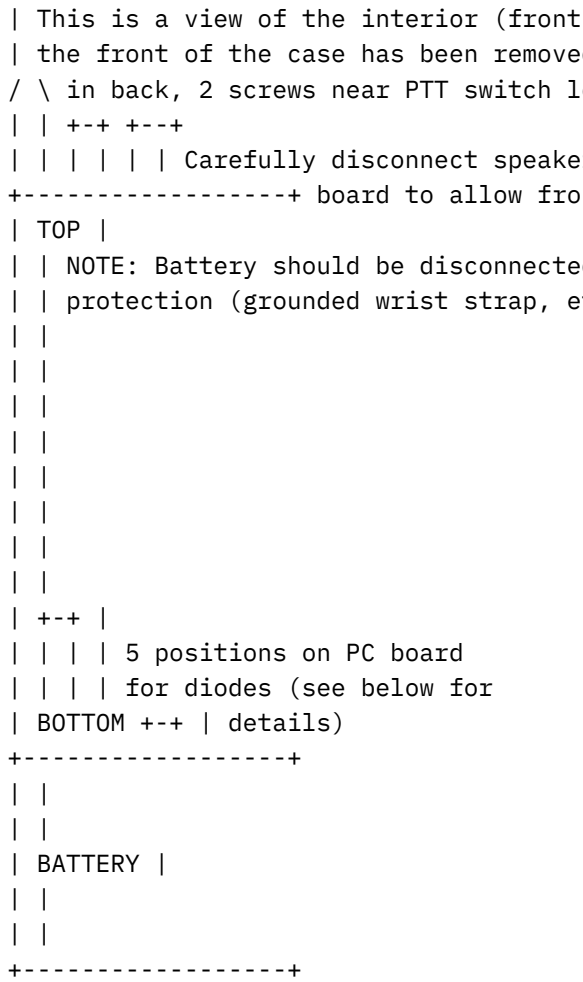
1295. IC-32AT Modifications

Newsgroup: rec.ham-radio
Date: 1989-06-16 11:15:28 UTC
From: kral@larkan.dec.com
Message-ID: <3010@shlump.dec.com>
Source record: 18228

>Hello All,
>
>I've noted a large number of articles concerned with mods for various
>equipments.
>
>Does anyone know of any mods for the Icom IC32 Dual Band (144/430) Handie ??
>
>Many Thanks & 73,
>
>Mike
>****
>

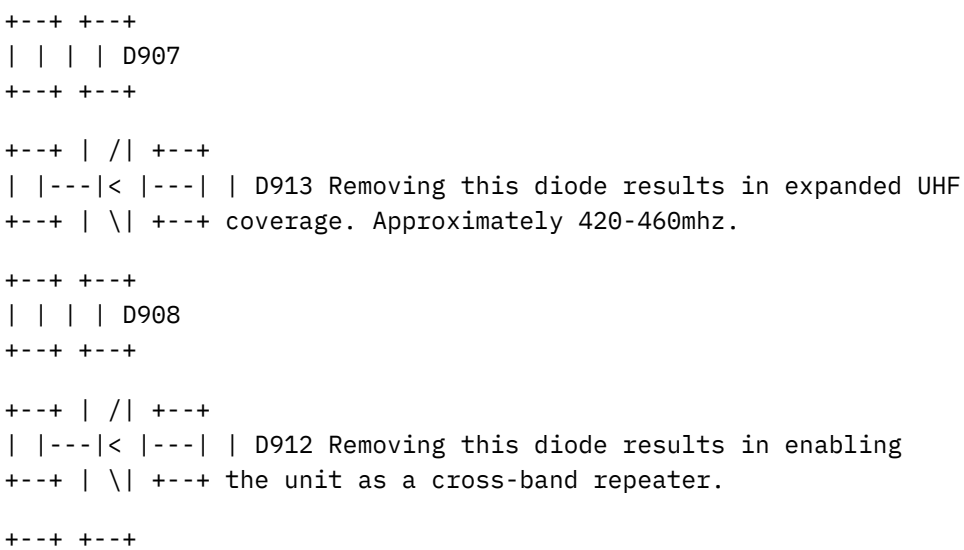
Here are 3 modifcations for the IC-32AT, one was taken directly from an ICOM
service bulletin. The following was partly done by NXION.



This is a view of the interior (front side) after
the front of the case has been removed (4 screws
in back, 2 screws near PTT switch loosened only).
Carefully disconnect speaker/mike cable from PC
board to allow front cover to be fully opened.
TOP
NOTE: Battery should be disconnected. Use ESD
protection (grounded wrist strap, etc.).
5 positions on PC board
for diodes (see below for
BOTTOM
details)
BATTERY

This shows diodes as installed at the factory.

TOP



D907
D913 Removing this diode results in expanded UHF
coverage. Approximately 420-460mhz.
D908
D912 Removing this diode results in enabling
the unit as a cross-band repeater.
D??? Installing a diode here (same polarity as others)
permits keypad entry of 10mhz digit.

BOTTOM

Icom Service Bulletin #13889-005

The IC-32AT has the capability of being used as a cross-band repeater.
This function is not enabled as the unit is shipped from the factory.

To enable this function perform the following steps:

1- Cut D912 on LOGIC UNIT. (see above figure)

2- Push and hold the (FUNCTION) switch.

3- Push the (C) key.

4- Push the (6) key.

5- Push the (D) key.

6- Release the (FUNCTION) switch.

To cancel "MINI REPEATER" perform the following steps:

1- Push and hold the (FUNCTION) switch.

2- Push the (D) key.

3- Push the (C) key.

4- Release the (FUNCTION) switch.

This is a correction of what I posted yesterday.
The transmitter is called Astro Com telephone broadcaster, made by
Saxton. It got an effective range of 25 feet. I bought if from You_do_it
electronics store. I can plug it into my Sony ICF 2003 and listen the
B.B.C. from my car radio.

The EPA is worse. The effects of PCB are transient. The symptoms of
PCB exposure are skin lesions and liver problems. These problems are
relatively mild and go away when you remove the exposure. There has
been no conclusive (or even statistical) evidence linking PCB to cancer.
There are certainly worse things that you can come accross in your
ham shack.

Is this the infamous Soviet "woodpecker" again? It got the name from sounding like a woodpecker and at one time was S9+30db for extended periods over much of the HF spectrum. I thought they had "civilized" it some by narrowing the bandwidth and power though. Just a thought.

My information (admitedly from memory) is from the "Industrial Chemical User's Handbook" which lists such things as toxic effects of the various chemicals and the precautions to be taken. Your local public library should have something similar if not the actual publication.

To summarize their report, the problem is that very small concentrations of PCB cause cancerous tumors. I remember parts per BILLION as being lethal under some circumstances. The problems BTW are not the "short term" effects (Ron is quite correct here), but the "long term exposure" effects. Having a gallon in your house is definitely going to give you those effects after a few years!

Remember most of the original uses of PCB insulators was in high voltage applications where contact or "exposure" is deliberately difficult for electrical reasons.

It is possible that there is newer information, but long term effects are extremly hard to prove or disprove and it is hardly worth taking a lot of risks just for an old dummy load or capacitor.

I too wish I knew a reasonable way to dispose of the stuff. I returned mine to the power company when I left so I wouldn't have it spilled while moving.

The gordon west tape are also part of the the study manual which can be
purchased from Radio Shack. They come complete with written test study
guides, FCC applications and are quite attractively packaged. They have
packages for Novice, Tech, and General though the Tech package is a study
guide only without tapes.

I fully agree with the above statement made by Ron Natalie.

While there are genuine health concerns with certain chemicals, many people have become downright paranoid anytime ANY chemical is mentioned. Speaking as both a chemist and an engineer, I can state with certainty that the PCB issue has been blown out of proportion. [I am firmly biting my tongue to prevent adding further details about the EPA and this topic].

Starting in the June 12, 1989 issue of THE NEW YORKER, there is a 3-part series written by Paul Brodeur on the subject of Electromagnetic Radiation. Part I deals mostly with ELF and power-line radiation, and has a reference to ham radio operators. Part II, in the June 19 issue, is on radar. The angle of Part I is the incidence of cancer among those more irradiated than others. I haven't read Part II yet....

I have, sitting out in my garage, a 5 kva pole transformer that I got
surplus about 20 years ago. I used to use it to power a homebrew HF linear
amplifier supply, but now it just sits gathering dust. This transformer almost
certainly contains PCBs, as we now all know. The question is, is it doing
any harm sitting in a corner of my garage (not leaking, obviously), and is
there any reason not to use it again should the approprate project arise?

Inquiring minds want to know...

On the assumption that it is not leaking, the transformer is doing
no harm.

On the assumption that: (1) it is not leaking; (2) it is in good
mechanical condition; and (3) it will not be subject to mechanical abuse
or excessive overheating, under the circumstances there is no reason why
you should not use it again. I would not recommend opening the transformer
to change the taps, however.

Virtually all electric utility companies (not to mention private
industry!) still have large numbers of PCB-filled transformers, capacitors,
circuit breakers, switches, reclosers, sectionalizers and oil-filled
underground cable in service with no ill effects upon people or the
environment.

And then we have PCB-impregnated fluorescent lamp ballasts.

I realize that there are some people who will disagree with the
above, but the basis for their disagreement will no doubt be media
sensationalism and not facts.

The Story of Digipeter Rabbit -- A No-Code Fable

Written by Frank Terranella, N2IGO

Once upon a time, in a far-away kingdom of Radio, there was a peaceful valley called Hamville, inhabited by a group of rabbits. Hamville was orginally settled by the Whiskey family, and the patriarch of that family was an old hare called Charlie Whiskey.

Charlie Whiskey was a farmer by trade. He came to the beautiful valley of Hamville when it was all open meadows. He saw the potential for farming the vacant land, and over time he developed a thriving carrot plantation. Charlie Whiskey's carrot plantation was the envy of all the inhabitants of the kingdom of Radio. He succeeded year after year in producing a bumper crop of carrots. All the other residents of the kingdom came to Charlie for advice on planting carrots. Charlie would always tell them, "The secret's in developing a good ear". No, Charlie didn't have superior hearing, but he had developed a very special skill. You see, Charlie picked his carrots with his ears.

In fact, Charlie had worked hard at perfecting this skill and was able to harvest at better than 20 carrots per minute. All of Charlie's family learned to pick carrots with their ears. Soon they were all picking at better than 20 carrots per minute. Charlie was so proud of his special skill that he insisted that everyone who came to work in Hamville first show that he could pick carrots with his ears. Charlie would not give new settlers any land unless they could demonstrate to his foreman, Victor Echo, that they could pick at least 5 carrots per minute with their ears. When they could pick at 13 carrots per minute, Charlie gave them more land to work. When they were able to pick carrots by ear at the rate of 20 carrots per minute, Charlie made them full citizens of Hamville.

This process of learning to pick carrots with your ears went on for some time. In other parts of the kingdom of Radio, other rabbits began to pick carrots by ear, however, there were some noisy ducks, known as the Quackers, who lived in the community of Good Buddy. They used their mouths to pick their crops instead of their ears. They had much larger mouths than the rabbits and saw no need to use their ears. The rabbits all looked down on the Quackers. "We must always require ear harvesting skills for entry into Hamville", they said. "That way we will keep out those noisy Quackers." So everyone who came to Hamville had to learn how to pick carrots by ear if they wanted to stay. Charlie Whiskey was adamant about that. "If you don't want to learn the skill of ear harvesting, then go work in Good Buddy with the Quackers", he would say.

And so the years passed, and new methods of farming were developed. These new methods were easier to learn than ear harvesting, especially for the animals who didn't have the big ears that the rabbits had. What's more, the new methods were just as efficient as ear harvesting. As time went by, fewer and fewer of the young animals were willing to learn the skill of ear harvesting. The population of Hamville began to dwindle. All the residents of Hamville were getting on in years. To make matters worse, there were new neighbors nearby who coveted the beautiful open farmland of Hamville. They wanted to come in and use it for commercial uses like shopping centers. And worst of all, the pollution from the Quackers, the other rabbits, and the Mice (known in Hamville as the QRM group) was having an adverse effect on farming in Hamville. The future looked bleak indeed.

Then, one day, a stranger called Digipeter Rabbit came to Hamville. He was an educated rabbit who studied at the School for Scientific Business (SSB). He had majored in Farm Mechanics and knew all of the latest scientific agriculture methods. But for all his education and know-how, there was one thing that Digipeter could not do. He could not master the skill of picking carrots with his ears, and since he already knew how to pick carrots more efficently with new scientific methods, he was not interested in learning.

Charlie Whiskey was outraged. "What do you mean you won't learn to pick carrots with your ears? Why, we in Hamville have been picking carrots that way for 75 years. It's a tradition here. It shows that we're special and that we're better than the Quackers. If you don't have the desire to develop a good ear, then we don't want you here in Hamville."

But Digipeter was adamant. He saw no reason to learn an obsolete skill just to stay in Hamville and he refused to even try. Charlie Whiskey took the matter to the Ancient Royal Rabbit League, which he founded. The ARRL decreed that everyone in Hamville must learn to pick carrots with their ears or be banished. And so Digipeter Rabbit left Hamville and founded his own village called Techietown.

Soon, all the young animals in the land of Radio were flocking to Techietown, but Digipeter had his own entrance requirement. A good ear and a good memory were not enough for him. No one could stay in Techietown unless they could demonstrate technical knowledge, understanding and ability, and the desire to contribute to the advancement of Techietown.

Digipeter encouraged all the residents of Techietown to experiment in the cultivation of new unexplored lands, never before farmed. Digipeter showed them how to overcome pollution problems. He showed them how to use the land they had more efficently. Digipeter even perfected a method of farming which allowed a number of rabbits to farm the land at the same time. And while the residents of Hamville were picking 30 carrots per minute on a good day, in Techietown harvests of 300 carrots per minute were possible. Using Digipeter's methods and those developed by the other bright, young residents, Techietown soon became the most prosperous village in the kingdom of Radio. This did not escape the notice of the Field Carrot Council, which governed the kingdom of radio. To reward the residents of the kingdom, the Field Carrot Council gave Techietown more and more land to work, until its borders touched those of Hamville.

Meanwhile, Hamville was still plodding along as it always had, oblivious to the revolution in farming occurring around it. The old hares still picked carrots by ear. The Ancient Royal Rabbit League complained bitterly to the Field Carrot Council about all the new land it was giving to Techietown, but the population of Hamville continued to drop. When the Field Carrot Council gave 2 acres of Hamville property to Techietown, the residents of Hamville began, for the first time, to be genuinely concerned about their plight. Some even dared to ask the Ancient Royal Rabbit League to change its mind about the need to learn to pick carrots by ear to live in Hamville. "We need new blood here to fight off the Field Carrot Council", they said. Charlie Whiskey, now in his nineties, was furious. "We have to maintain our standards. We don't need those smart young bunnies, we need rabbits skilled in our time-honored harvesting techniques. We need rabbits who are dedicated enough to the principles of Hamville to want to learn our methods. If a rabbit really wants to live here, he'll learn our ways. If he doesn't, we don't want him. You don't want those Quackers to move here, do you?"

But by now the residents of Hamville had seen the writing on the wall. Although they genuinely enjoyed picking carrots with their ears, they realized that there were now other ways which yielded just as many carrots. And though they would probably continue to pick carrots by ear as they always had, they could no longer shun those bright young rabbits who chose a more modern method. A group of rabbits, led by an elder statesman rabbit named Elmer, who had once served in the government of the kingdom of Radio, asked the Ancient Royal Rabbit League to change its policy. The League agreed and issued a decree that henceforth ear harvesting skills would not be required to become a resident of Hamville.

When Digipeter heard of the decree, he sent envoys to Hamville with all the latest scientific discoveries, which he shared freely with the residents. The residents of Hamville seized upon the new knowledge and soon Hamville became revitalized. Its population began to increase as young rabbits were attracted to its bountiful open farmland. The Field Carrot Council, impressed by the renaissance in Hamville, did not take away any more land, but actually gave some new territory to Hamville. Everyone was amazed at the new vibrancy of Hamville.

Charlie Whiskey, though sad that his beloved harvesting method was no longer in vogue, saw that his people were prospering and was glad. And to show that there were no hard feelings, Charlie Whiskey sent Digipeter Rabbit a packet of 73 carrots which he had picked himself -- with his ears.

The residents of Hamville rejoiced and declared a festival to celebrate their new prosperity, and over the front door of the Hamville Festival they put a banner, which read: "A bunny's worth is measured not by the skill of his ears, but by what lies between them." The residents of Hamville had learned an important lesson.

The End.

You people do know about over the horizon radars, don't you?

The soviet one is a pulse system, with about a 10 hz repetition rate,
about a 100 Khz bandwidth and saunters up and down the bands looking
for the best propogation. Everybody calls it the Woodpecker.

The US one (aren't you glad we are adding to the QRM too :-)) uses
a FM , and if the signals I've heard are it, it is a CW carrier
swept up and down quickly (again 3 to 10 HZ) over a couple of
hundred Khz. This just put a little tick as it sweeps thru the
recievers bandpass.

What the Austrailian one sounds like, I'm not sure.

>
>>Excellent! That's an old fantasy of mine
>
>Its a fantasy of mine too, but I have played with enough RC planes to spot
>a couple of problems.

Details of why it won't work omitted.

Well, maybe the group over in Sumter, South Carolina didn't think about all those details. They have an active ATV group and an active RC flying group. There's at least a little overlap!

I haven't seen the plane fly, but I have seen it on display and seen video tape of what it "sees".

It's a high-wing plane with (boy memory is fuzzy!) perhaps 4 ft wingspan. The camera is suspended from beneath the right wing and "sees" through the propeller (shows up as shiny arc in upper left of image when the sun hits just the right angle).

The video was fascinating! Extremely dis-orienting as the plane goes through the usual RC gamut of loops and rolls.

I somebody wants to follow up, track down Hap Griffin, WA4UMU via the callbook. He is a rather "recognized" name in the ATV world, and could point you to the specific people involved in the project.

> are ESPECIALLY susceptible to anything they see or hear. If you want to tell your
> own kids to use drugs, fine, but let's keep it off a PUBLIC network where there
> are many college age kids.

Saying that drugs are not dangerous is like saying cars are not dangerous.
BOTH can be abused, and we know both get abused. I think the issue being
raised here is "why make the thing illegal, when we can make the abuse of
the thing illegal". Cyanide does NOT kill unless it is ingested. Guns
do NOT kill unless they are fired at someone.

Of course we know that children are not wise enough to know how to avoid
abusing these things, so there ALSO needs to be the responsibility on the
part of all adults to make sure children do have a chance to drink poison,
shoot their little sister, run someone over with a car, or take a drug that
can cause physiological destruction.

But let's not be saying that the thing in and of itself is dangerous when
it is only dangerous when abused.

By the way, I believe the parents of the child who shot his little sister
should be locked up for 5 to 10 years. I hear that Florida is trying to
pass a law to make that easier to do, but I hope they try with what they
have now.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

SpaceNews

MONDAY JUNE 19, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly
around the world. It is available for UNLIMITED distribution.

* OSCAR-9 NEWS *

It looks like OSCAR-9 will NOT be taking any CCD pictures for some time.
A revised operating schedule was recently issued for OSCAR-9. Diary software
reloads will still take place on Tuesdays. Digitalker telemetry will follow.
The telemetry channels currently being downlinked via the Digitalker include:

08 : Battery Pack A Temperature (C)
18 : Battery Pack B Temperature (C)
22 : Battery Voltage +14V (Volts)
29 : Spacecraft -Y Facet Temperature (C)
35 : 145 MHz Beacon Output Power (UnCalibrateD)
39 : Spacecraft +Y Facet Temperature (C)
49 : Spacecraft +Z Facet Temperature (C)
59 : Spacecraft -Z Facet Temperature (C)

From Thursday at around 12:00 UTC, the spacecraft will transmit the following
sequence of data at 1200 bits/second:

Telemetry : 60 seconds
News Bulletin : 60 seconds
Whole Orbit Data (WOD) : 150 seconds

This will continue until 06:00 UTC on the following Tuesday when the beacon
will switch off to help facilitate a software reload.

The recent solar flare has greatly increased OSCAR-9's orbital decay rate.
This means OSCAR-9 will come into range a few minutes before your predicted
times of AOS. Here is element set 588 for UO-9 as issued by NASA on 13Jun89:

Epoch : 89 161.08290495
Incli : 97.5527
RAAN : 214.2327
Eccen : 3.717E-04
ArgPer : 153.8947

MeanAn : 206.2960
MeanMo : 15.59543431
Decay : 8.6255E-04
RevNum : 42788

* UoSAT-D NEWS *

Harold Price, NK6K has been performing some performance tests on the UoSAT-D PCE, the Microsat CPU, and other machines. The results are summarised below.

Using a dhryston C benchmark from Sept. '86 DDJ p.88, here are some performance numbers (using a 6MHz AT as the index). The same compiler and options were used (/AS /Ze /Zp /Ot /Gs). /Gs (no stack checking) was used because the S/C stack check is different than the dos version. Normally /G1 (80186 instruction set) would be used for S/C programs.

The RIC is the PC card we're using for the simulator and for SW development.

Device CPU Clock dhrystons/sec index

Toshiba 3200 80286 12 MHz 3762 2.03
AT Clone 80286 8 MHz 2145 1.16
IBM AT 80286 6 MHz 1850 1.00
UoSAT PCE 80C186 7.3728 MHz 1398 + 0.75
RIC 80186 7.3728 MHz 1391 + 0.75
AMSAT proto V40 7.372 MHz 861 0.47
AMSAT flight V40 4.608 MHz 538* 0.29*
IBM PC 8088 4.77 MHz 1531 0.29

+ The timer resolution of 10ms gives an uncertainty of +/-14 counts, these numbers are equivalent.

* calculated based on clock speed difference from wirewrap.

The RIC, Microsat Prototype, and UoSAT tests were done under the kernal, so clock and scheduler overhead are included. Zero wait states were used.

[Story via OSCAR-9]

* OSCAR-11 NEWS *

A new binary dump format is now operating in the Forth Diary cycle.
The general format of the packet is as follows:

Sync 1 - 50H
Sync 2 - 41H
Frame Count MSW
Frame Count LSW

...64 bytes of data...

Checksum MSW
Checksum LSW - 16 bit addition of all bytes excluding syncs.

This data is transmitted for 15 seconds after the news bulletin, between the Single Event Upset (SEU) dump and the Whole Orbit Data (WOD) dump in the current schedule, and contains engineering data. It is anticipated that WOD using this "packet" format will be introduced into the Diary schedule soon.

* OSCAR-13 SCHEDULE *

Date : 14Jun89 until 16Aug89 | 16Aug89 until 16Nov89
Attitude: 180/0 | 210/0
Mode-B : MA 0 to MA 110 | MA 3 to MA 160
Mode-JL : MA 110 to MA 145 | MA 160 to MA 200
Mode-B : MA 145 to MA 255 | MA 200 to MA 240
OFF : % | MA 240 to MA 3
Mode-S : MA 150 to MA 160 | MA 210 to MA 222

Also, for a trial period the OMNI-directional 70cm antenna will be connected to the Mode-B RCVR from MA 20 to MA 40. These changes have been introduced to enable stations who have access around perigee to experiment with perigee operation. Mode S unchanged. 14May89: BLON/BLAT 212.0/+2.4 with a drift rate of 0.016/-0.061 deg/day, respectively.

Transponders will be in operation during the whole orbit from June 14 until Aug 16 due to excellent sunangle and power budget. No perigee operation between August and November due to perigee solar eclipses!

>Details of why it won't work omitted.

Gawd - I hope it didn't come across as THAT negative! My intent was to point out things to consider and resolve without "finding out the hard way".

I certainly don't know ANY reason why it wouldn't work, given some time and effort to work out the problems involved. I would suggest LOTS of foam padding (standard in R/C planes - but probably 1" or so to start with), and something more rugged than a "bare board" xmtr. The AAA5 (Az ATV group) showed a nifty 1 transistor 250mw xmtr that works at 1.2 Ghz that might be just the thing - with the board appropriately braced etc.

Most of the rest (as I recall) is standard RC stuff which you need to be aware of anyway. I don't know - did I miss any potential problems? The folks at our field (Az Model Aviators) have tried about every crazy trick in the book, but CAREFULLY so no-one gets hurt!

We even have a genuine turbo jet powered RC aircraft here, but THAT is not anything for novices (or anyone else who doesn't build them for a living!)

Hi,

A friend of mine recently aquired an ICOM R70 and is interested what mods are available. We've heard about mods to increase the frequency coverage and to improve AM reception.

If you have any such mods - please email them to me !

Thanks
Stuart N6TTO

I'm a collector of antique radio equipment and books. I'm looking for
old (pre-1950, probally pre-1940) books on radio theory, repair, etc.
Though not a primary area of interest I'd consider books on early TV,
general electronics/scientific (e.g. The MIT Rad Lab series) or
radio related fiction.

If anyone has material they'd be willing to part with please send a list
(specifying Author, Title, Date and Price) to me vi email or US mail.
If a list seems like too much trouble (and you have several titles), just
send your phone number & I'll get back to you.

Thanks much,
---Tom Adams---

1323. ham test

Newsgroup: rec.ham-radio
Date: 1989-06-19 18:50:40 UTC
From: mn@atari.UUCP
Message-ID: <1577@atari.UUCP>
Source record: 18243

I would like to propose the creation of a new class of ham license that
would be ranked above the grade of Extra.
The new grade of ham license would not add any new privledges but would
be of immense benefit to VE's. The new class would be designated as
Existential class.

EXAMINATION RULES

The test is to be given by an Extra grade license holder
who is not related to the applicant and lives at least 50 miles
from said applicant.
Before the test the examiner takes the exam himself and places
his marked test in a sealed envelope. Then the applicant is given
his copy of the test and five minutes to complete it.
The examiner compares his own answers against the applicants
answers and if they are all the same the applicant has passed.
Upon passing the test the applicant fills out the required form
and pays a nominal fee of $5,000 in unmarked 10's and 20's to the
examiner who then forwards the form to the FCC.
If and when the FCC sends the applicant his new license he is
then authorized to administer the test and in 10 years retire
in the Bahamas.

So, with keyboard ready and tongue firmly planted in-cheek, let's
see if you've got what it takes to be a Existential class ham!

---
1. If the FCC sends you a Notice of Violation you should

(a) run and hide under the bed
(b) respond within 10 days
(c) blame it on the Libyans
(d) get drunk and beligerant, then write a reply

2. The term MUF refers to

(a) minimum useable frequency
(b) an intimate portion of the female anatomy
(c) maximum useable frequency
(d) my uncle Fred

3. Third party communicationms with Israel are

(a) legal only on Saturdays
(b) not allowed by the FCC
(c) permissable with a rabbi present
(d) conditional on giving Yasser Arafat equal time

4. The abbreviation CW stands for

(a) canned worms
(b) country-western
(c) continious warble
(d) code wars

5. A dipole is

(a) a Polish silent key
(b) pretty big at 160 meters
(c) a balanced antenna
(d) a fishing rod made in Korea

6. Using antique tube-driven ham gear will

(a) give you a hernia just trying to key the transmitter
(b) qualify your shack as a historical site
(c) make other hams reason to doubt your sanity
(d) give the cat a warm place to sleep

7. One of the favorite topics of conversation among old hams is

(a) the good old days of decent propogation
(b) the brand of laxative they use
(c) how easily they passed their last ham examination
(d) their number of divorces due to ham activities

8. A bug is

(a) a term for a telegraph key
(b) what your new $2000 solid state rig is riddled with
(c) what gives you the flu
(d) creaping up your arm

9. One reason hams must show proficiency in Morse code is

(a) to keep CB'ers where they belong
(b) to make newcomers pay their dues
(c) to remember where they hid their Jet Jackson decoder ring
(d) to keep secrets from the wife while sending his mistress
CW love letters

10. During QSO's with hams in the USSR you should

(a) not get them angry because they're probably drunk
(b) ask them to please turn the woodpecker off
(c) wager on the longevity of the current Soviet president
(d) avoid talking about politics

Only kidding.....

> partial list) but not 11 codes. Does anyone know where I can get the
> 11 codes, as well as the 10 codes I don't have? Is this considered
> resticted information? Would the police put me in jail if I asked them
> about their codes? Is there a book with 11 codes?

I used to be a police dispatcher 23 years ago. I know of no 11 codes, but that doesn't prove anything. Local police are free to designate their own codes. Even the conventional 10 codes need not necessarily have the same meaning everywhere. Local chiefs are free to redefine any of them they wish to. So, even if you get the list you want, it may not help.

No, they won't get mad if you ask. They may not answer, but they can't keep you from asking.

Shutting up means acceptance of the situation. If hams shut up, then we
soon won't have ANY bands.

By the way, Kevin, be sure to make it to the ham classes this fall so you
can post a signature here with a real ham call on it.

Dear All,

Does anyone on the net have information on mailboxes in West Germany.
I am paticularly interested in contacting friends in Iserlohn, a town
to the south-west of Dortmund. I would appreciate details of callsigns
for mailboxes/nodes in :-
Iserlohn/Altena
Duesseldorf
Dortmund
Hagen/Schwerte

I've posted in English since there maybe others outside DL who could help.
I am fluent in German, so write in Deutsch if it's easier !!

Update to my earlier posting- after calling around to get the accessories for my new 10m monobander I discovered that *nobody* has the accessories I need- not even Kantronics! I'm mildy upset. As a mobile rig this little beast isn't going to be too useful without a noise blanker.

Kantronics tells me that they were not very good sellers, which is a real pity as they're excellent little rigs. I imagine this box will become my canoe and backpack mobile rig, and maybe I'll shoehorn the TS-140 into the Honda...

If you're looking for a good little rig, it's still a fine radio. The 20m box might be a great minimalist's DX station. But if you need the CW filter, mobile bracket or noise blanker, make sure the dealer has 'em in stock when you order. (Neither AES or Missouri- who bought out the last Kantronics stock- have 'em in).

A slighter sadder and infinitely wiser KE8YY

Wow!!! I sure hope he is intending to use a commercial radio link since doing this on 2M, 220, 440 etc... would not make the FCC happy since using Ham Radio to avoid the charges of the phone company is a very bad thing to do

1331. WWV Propagation Information - Summary

Newsgroup: rec.ham-radio
Date: 1989-06-20 16:14:00 UTC
From: CSMSCST@OAC.UCLA.EDU
Message-ID: <8906210706.AA10008@ucbvax.Berkeley.EDU>
Source record: 18251

The same propagation indicies that WWV broadcasts at HH+18 are available via a recorded msg at (303)-497-3235. This info is footnoted in "Propagation Forecasting during Cycle 22" in the June 89 QST.

One can also call the general purpose WWV number (303)-499-7111, which plays the same audio as is being broadcast. To get the propagation info, you would have to call at HH+18.

(Thanks various direct responses.)

Can anyone point me to a definition of the "A index"?

Message-ID: <191200011@uicsl.csl.uiuc.edu>
Source record: 18253

I too, was anxiously waiting for some further information, but hearing none
I decided to do a little crude experimenting to verify whether or not it
seemed a valid theory (There has been considerable discussion, including
skepticism about the theory of the CFA). The conventional wisdom has been
that the "current-portion" of the antenna is the most important factor for
radiating power. The CFA theory ignores this and offers only "high-voltage"
features and "none" of the antenna has "rf-current" in its physical elements!
I'm only in the "laymen" category, but here are some of my results:
Not wanting to appear too foolish, I only made a small model, which probably
is not a fair way to evaluate. (The article in Mar 89 "Electronic & Wireless
World" shows a sketch of the full, balanced version). My model was only the
"half" version such as someone said is offered for sale commercially in the
British Call-book. I happened to have a portion of a 4' x 8' insulated
sheathing-board (48" x 56")..1" thick and aluminum foil on both sides which
I used as a ground-plane to tune the "half-model" against. My "cylinder" was
13" diameter and 15" tall and both ends open. The "disc" was also 13" diameter
with a 1/2" hole in the center to pass a shielded coax thru. These dimensions
were quite arbitrary on my part...just what I happened to have around.
Schematically, I used two roller-inductors (28 uh max)...their "hot" ends
fed the "disc" and "cylinder" elements..one to each..thru short lengths of coax
(these may break down if you run too much power), and the bottom ends are
tied together and coupled to the ground-plane thru a "common" pi-capacitor.
I chose to use the "natural capacitance" of the 48" x56" board for the
pi-capacitor (top-foil for ground-plane..bottom foil for common ends of induct-
ors and feed-point for power in) and it may have been dumb-luck but I was able
to tune for perfect SWR match (I chose to use 75-meters for testing)...
to the 50-ohm transceiver coax cable. The natural stray-capacitance
of the disc & cylinder (to ground-plane) provide the "C" for resonance at a
very high impedance value (thus high-voltage). It appears to me that the only
way to increase power, is to increase the voltage to the elements. With 100
watts, a substantial rf arc can be drawn off either element with a lead-pencil.
I placed the foil-board on saw-horses and set the disc 2" above on styro-
foam spacers, and set the cylinder 2" above the disc on stryofoam spacers.
I convinced myself that the CFA concept works because I got very decent
reports around the city, and "very weak-but-readable" reports to about 150 mi
radius in the brief time I was testing. (Band conditions were not the best).
Also, I improvised a small shielded one-turn loop thru a rectifier-filter to
a 20 ua panel-meter to observe isolated current samples around the perimeter.
The energy was present with the loop in the vertical-plane, and nil when
the loop was turned parallel to the ground-plane. I did not bother to shield
the roller-inductors, but I don't believe that would have changed the results.
I am encouraged enough that I plan to build a larger model next fall for
testing on 160-meters where the competition isn't so overwhelming.
Just as an additional side-note, I got the crazy idea to try a single-

plane model instead of the cylinder..since I still had the remaining scrap of insulation-board (48" x 40"). I cut it into 40" x 22" and 40" x 26" and used the 22" x 40" to substitute for the disc, but placed it at one end of the ground-plane, rather than in the center, with the crazy hope that maybe it could exhibit some directivity. I spaced it 3", and then set the 40" x 26" panel 3" above, and perpendicular...above the edge nearest the center of the ground-plane. I tied the foils common on each individual panel. The ground-plane was used the same as before (as the pi-capacitor).

It also tuned up nicely and loaded to a perfect 50-ohm SWR match, but in the brief time that I tested, it did no better than the smaller model and so far as I could tell, showed very little directivity.

In summary, everything I did, seemed to be non-critical insofar as spacing and tuning was concerned (maybe I was missing some secret technique??). I watched the little current sensor while tuning interactively on the inductors but saw no dramatic critically-sharp improvement.

The cylinder-disc model had a 2:1 swr bandwith of about 12 khz as I recall, and the other rectangular model was considerably wider...probably 40 khz.

It seems to me that the bandwidth is only determined by the nature of the tuning network that you select....but high-voltage and broad-band are inherently contradictory.

It's certainly possible that my crude techniques have missed some critical phase-amplitude relationship which will load the tuned ciruits heavier in which case the bandwidth would be broadened. On the other hand, I was delivering 100 watts to the system and there was no discernible heat that was being generated so most of the power must have been radiated in some fashion. Perhaps my observations will stimulate some others to do more experimenting on Crossed-Field Antennas.

1334. Kantronics 10M monobander

I finally bought one of these little buggers at a swap, having found hwta appeared to be a very good price- $275. (List is $360; AES wants $330). It is, as I remembered, very good; the reciever is certainly better than a Uniden/RS/Clear Channel, though it does lack FM.

However...opening the box on the way home I read the manual and discovered that three things that really ought to be standard are options: Mobile bracket, noise blanker and CW filter. *Sigh*. I took it out last night in the car with a quick lash-up and found (under dead-band conditions) that a noise blanker is a *must*, unless you do all your operating with the engine off ("uh, stand by OM, gotta turn the engine back on at the bottom of this here hill...") Nonetheless, it's a very good rig. I think when 10 starts to fold up in a few years I'll go buy one of their 20m rigs, too. Maybe sooner than that; I still need something for late night use in the car, too.

The following traffic was on the SWL mailing list. I would like it to
get greater exposure, so am forwarding this extract to the Info-Hams
list (and thereby to rec.ham-radio). What do Canadians think of this?
-- Will Martin:

>Date: Tue, 20 Jun 89 11:54:33 EDT
>From: Sergio Gelato <gelato%ASTROSUN.TN.CORNELL.EDU@PUCC.PRINCETON.EDU>
[Extract]...
Sunday's SWL Digest also contained a report on the Canadian
government's decision to cut CBC's budget by CDN$ 140 million over the
next five years. How these cuts will be distributed hasn't quite been decided
yet, but the people in the short wave service are worried, and would appre-
ciate reception reports even more than usual...
...
>Date: Tue, 20 Jun 89 14:36:39 CDT
>From: Will Martin <wmartin@st-louis-emh2.army.mil>

Regarding the CBC budget cut and its possible effect on RCI: One of the things
Ian McFarland mentioned during the referenced broadcast was that he was
encouraging people to send letters to RCI -- during previous budget-cutting,
having a lot of listener mail was a good defensive point for RCI and helped
them hold on to their own budget allotments. So now would be a good time to
write; I'm one of those people he mentioned who listened for years but did
not write (except for postcards for their contests), so now I should force myself to write
them... (US readers, remember that this last postal increase
made mail to Canada more expensive than mail within the US and to Mexico --
the first such discrimination in many years. You'll have to put 30 cents on
your letters... :-( )

Anyway, what I am posting this for is to promote an idea I had and to
encourage you-all to include this concept in your letters to the CBC and
RCI. Some of the possible budget cuts would be implemented in cutting
back on local CBC stations throughout Canada, perhaps reducing them to
one "official" CBC station per province. This was decried in an
editorial Ian read, but it may happen. If the CBC does cut back on
individual stations like this, there still is a mission and a need for a
tryly *national* Canadian service, which was before, and is now to some
extent, provided by a network of local stations. If such a network can't
be afforded any longer, this is a PERFECT opportunity to institute a
national Canadian *shortwave* service! One or two shortwave stations
could replace a sizable number of local FM or mediumwave stations, and
carry the CBC national programming all over Canada. Why am I interested
in this? Because, as a USAnian, this way *I* can also pick up the good
CBC programming that I can't receive now. The Northern Service used to
be prevalent enough that it was a source for such CBC programming on

shortwave, but it has dwindled to near-nonexistence (I believe being replaced by satellite services). This budget cut, if it is implemented in such a way as to reduce local outlets, would restore the utility of shortwave as a method to serve not only the remoter parts of rural or wilderness Canada, but also the towns and even cities which will lose their local CBC outlets due to the budget cutbacks.

It would obviously be cheaper to operate one or two SW stations than 10 or 15 individual local stations, but the CBC would get greater territorial coverage from the former. A transition advertising campaign could promote shortwave and encourage Canadians who would lose their local CBC outlets to buy SW radios to receive the new national SW service. This would help the Canadian SWL community in general, of course, by increasing the ranks of SW listeners and thereby increasing the receiver market, thus lowering prices and encouraging more manufacturers and dealers to enter that arena. More people receiving SW means more people likely to want to put up outdoor SW antennae, which in turn will help slap down evil anti-antenna lease clauses and restrictive real estate covenants. And all of us USAnians get to pick up the CBC on SW as a side benefit! (Plus, of course, worldwide DXers and SWLs get access to the CBC programming as propagation permits...)

A real 24-hour (or nearly so) CBC shortwave outlet would let RCI drop some of its rebroadcasts of CBC programming, perhaps keeping only the overseas relay transmissions of such, and that would let them air more repeats of RCI-originated programming or cut back in order to meet their own budget cuts without affecting the listeners who now listen to those uniquely-RCI programs (like SWL Digest). They might even be able to shave some costs related to the SW transmitter site(s) by combining support jobs or related expenses with the new CBC shortwave installation. (For example, I could see setting up a new Western transmitter site right at some source of hydroelectric power, to minimize power costs, and RCI could share in this installation...) I suppose the existing Sackville site could be used for an Eastern CBC SW transmission point, with an antenna aimed in a wide lobe West, so the CBC would thus share in the support costs of that location.

Anyway, it sounds like a sensible idea to me. The whole concept of a major industrialized nation setting up a national shortwave service at this date would be delightful! It could boost the general awareness of SW world-wide. It would encourage the growth of national SW broadcasters in the US, too. (Now, most of them are funded by religious organizations, and have to maintain a fiction of intending their broadcasts for outside the US. A national internal-Canada SW service would practically force the FCC to officially allow internal-to-the-US SW broadcasting, which is sort of technically forbidden currently.) I can foresee other side effects, like commonly-available SW-coverage car radios...

Push this in your letters!

Regards, Will Martin

Why am I receiving international shortwave stations on the
AM dial? In the last three or four months, I find signals
coming through clearly on three different oridinary AM
receivers. Just past 1600Khz, I can clearly pick up the
BBC World Service, die Deutsche Welle, a French broadcast
(I believe this is Radio Canada Internationale), the ever-
popular Radio Moscow, Radio Japan, and a few others. This
was not present at any previous time, to my knowledge, on
these receivers (one of them is a little plastic Realistic
transistor radio). I live in Boston, so I'm close to the big
RCI relay transmitter in Sackville, Ontario, but this is still
a new development. I've even taken the little pocket radio with
me to a location some 45 minutes south of the city, and the
results are the same. I'm used to getting the occasional
sporadic-E skip signals from various North American stations,
and maybe even some Caribbean or Central American stations on
some nights, but this is different. I can pick up most of these
signals anytime, day or night, almost all above 1600, occasionally
something a little further down, around say 1200-1500 Khz. And
I'm sure I never received these signals on these frequencies
before recently.
What's up?

-> Can someone tell me what the Farnsworth ratios are, or give
-> me a pointer to a description. Ie, normal morse is spaced
-> 1/3/7 (between elements/letters/words). Is Farnsworth a
-> particular spacing (like 1/9/21), or does the name just
-> refer to fast characters with long spaces? The ARRL
-> Handbook seems to discuss only normally-spaced morse.

As far as I have heard, it is just fast characters with long spaces.
For example, speeds of 13 to 16 wpm for the characters, spaced out
to be 5 wpm.

The only difficulty seems to be in telling word spaces from character
spaces, but that never seemed easy at 5 wpm.

-> Also, does anyone have a CW pgm for a Mac? I'd like to see
-> how the sound manager calls work. I wrote one in Basic but
-> can't get it to sound right over 20 WPM. Thankx.

Did the basic version not use the sound manager calls directly?

I have written a few Morse programs, mostly for the Mac. They have had
some trouble because of an apparent problem with the Macintosh sound
driver. I have sent the problem to Apple several times in the last
year. If they ever provide a useful answer, I may actually get good
non-clicking cw from the Mac.

Yes, there is.

Call (303) 497- 3235 for the same propagation forecast as is broadcast by WWV. About the only time it's unavailable is when the forecast is being updated, or when the lines are busy.

BTW, for those who don't know, the time hacks can also be dialed up any time of the day- call (303) 499- 7111 for the same stuff as is being currently transmitted by WWV.

Hope this helps.

1345. K Index and other Geomagnetic trivia

Newsgroup: rec.ham-radio
Date: 1989-06-21 14:38:20 UTC
From: mszekula@PICA.ARMY.MIL
Message-ID: <8906211038.aa26347@AC4.PICA.ARMY.MIL>
Source record: 18267

The following two files were downloaded from the NOAA
Phone BBS system. There is probably more here than you'll ever
want to know.

Mike - N2HJT

GLOSSARY OF SOLAR-TERRESTRIAL TERMS

a INDEX. A 3-hourly "equivalent amplitude" index of local geomagnetic
activity; "a" is related to the 3-hourly K INDEX according to
the following scale:

K 0 1 2 3 4 5 6 7 8 9
a 0 3 7 15 27 48 80 140 240 400

A INDEX. A daily index of geomagnetic activity derived as the average of
the eight 3-hourly a indices.

ACTIVE. Geomagnetic levels such that 15 <= Ap < 30.

ACTIVE DARK FILAMENT (ADF). An ACTIVE PROMINENCE seen on the DISK.

ACTIVE LONGITUDE. The approximate center of a range of heliographic
longitudes in which ACTIVE REGIONS are more numerous and more
FLARE-active than the average.

ACTIVE PROMINENCE. A PROMINENCE displaying material motion and changes
in appearance over a few minutes of time.

ACTIVE PROMINENCE REGION (APR). A portion of the solar LIMB displaying
ACTIVE PROMINENCEs.

ACTIVE REGION (AR). A localized, transient volume of the solar atmosphere
in which PLAGEs, SUNSPOTS, FACULAe, FLAREs, etc. may be observed.

ACTIVE SURGE REGION (ASR). An ACTIVE REGION that exhibits a group or
series of spike-like surges that rise above the limb.

AFRED. Abbreviation for the A INDEX for Fredericksburg.

ANGSTROM. A unit of length = 1.0E-08cm.

Ap INDEX. An averaged planetary A INDEX based on data from a set of specific
stations.

ARCH FILAMENT SYSTEM (AFS). A bright, compact PLAGE crossed by a system of
small, arched FILAMENTS, which is often a sign of rapid or contin-
ued growth in an ACTIVE REGION.

ASTRONOMICAL UNIT (AU). The mean earth-sun distance, equal to 1.496E+13cm or 214.94 solar radii.

AURORA. A faint visual phenomenon associated with geomagnetic activity, which occurs mainly in the high-latitude night sky; typical auroras are 100 to 250 km above the ground.

AURORAL OVAL. An oval band around each geomagnetic pole which is the locus of structured AURORAe.

AUTUMNAL EQUINOX. The EQUINOX that occurs in September.

BARTEL'S ROTATION NUMBER. The serial number assigned to 27-day rotation periods of solar and geophysical parameters. Rotation 1 in this sequence was assigned arbitrarily by Bartel to begin in January 1833.

BRIGHT SURGE ON THE DISK (BSD). A bright gaseous stream (SURGE) emanating from the CHROMOSPHERE.

BRIGHT SURGE ON THE LIMB (BSL). A large gaseous stream (SURGE) that moves outward more than 0.15 solar radius above the LIMB.

BURST. A transient enhancement of the solar RADIO EMISSION, usually associated with an ACTIVE REGION or FLARE.

CARRINGTON LONGITUDE. A system of fixed longitudes rotating with the sun.

CENTIMETER BURST. A solar radio burst in the centimeter wavelength range.

CENTRAL MERIDIAN PASSAGE (CMP). The passage of an ACTIVE REGION or other feature across the longitude meridian that passes through the apparent center of the solar DISK.

CHROMOSPHERE. The layer of the solar atmosphere above the PHOTOSPHERE and beneath the TRANSITION REGION and the CORONA.

CONJUGATE POINTS. Two points on the earth's surface, at opposite ends of a geomagnetic field line.

CONTINUUM STORM (CTM). General term for solar noise lasting for hours and sometimes days.

COORDINATED UNIVERSAL TIME. By international agreement, the local time at the prime meridian, which passes through Greenwich, England. Therefore, it is also known as GREENWICH MEAN TIME, or sometimes simply UNIVERSAL TIME.

CORONA. The outermost layer of the solar atmosphere, characterized by low densities (<1.0E+09/cc) and high temperatures (>1,0E+06deg.K).

CORONAL HOLE. An extended region of the CORONA, exceptionally low in density and associated with unipolar photospheric regions.

CORONAL RAIN (CRN). Material condensing in the CORONA and appearing to rain down into the CHROMOSPHERE as observed in H-ALPHA at the solar LIMB above strong SUNSPOTS.

CORONAL TRANSIENTS. A general term for short-time-scale changes in the CORONA, but principally used to describe outward-moving PLASMA clouds.

COSMIC RAY. An extremely energetic (relativistic) charged particle.

CROCHET. A sudden deviation in the sunlit geomagnetic field (H component; see GEOMAGNETIC ELEMENTS) associated with large solar FLARE X-ray emission.

D REGION. A daytime layer of the earth's IONOSPHERE approximately 50 to 90 km in altitude.

DARK SURGE ON DISK (DSD). Dark gaseous ejections visible in H-ALPHA.

DIFFERENTIAL ROTATION. The change in SOLAR ROTATION RATE with latitude. Low latitudes rotate at a faster angular rate (approx. 14 degrees per day) than do high latitudes (approx. 12 degrees per day).

DISAPPEARING SOLAR FILAMENT (DSF). The sudden (timescale of minutes to hours) disappearance of a solar FILAMENT (PROMINENCE).

DISK. The visible surface of the sun (or any heavenly body) projected against the sky.

Dst INDEX. A geomagnetic index describing variations in the equatorial RING CURRENT.

E REGION. A daytime layer of the earth's ionosphere roughly between the altitudes of 85 and 140 km.

EMERGING FLUX REGION (EFR). An area on the sun where new magnetic flux is erupting.

ERUPTIVE PROMINENCE ON LIMB (EPL). A solar PROMINENCE that becomes activated and is seen to ascend from the sun.

EXTREMELY LOW FREQUENCY (ELF). That portion of the radio frequency spectrum from 30 to 3000 hertz.

EXTREME ULTRAVIOLET (EUV). A portion of the electromagnetic spectrum from approximately 100 to 1000 angstroms.

F CORONA. Of the white-light CORONA (that is, the corona seen by the eye at a total solar ECLIPSE), that portion which is caused by sunlight scattered or reflected by solid particles (dust) in interplanetary space.

F REGION. The upper layer of the IONOSPHERE, approximately 120 to 1500 km in altitude. The F region is subdivided into the F1 and F2 regions. The F2 region is the most dense and peaks at altitudes between 200 and 600 km. The F1 region is a smaller peak in electron density, which forms at lower altitudes in the daytime.

FACULA. A bright region of the PHOTOSPHERE seen in white light, seldom visible except near the solar LIMB.

FIBRIL. A linear pattern in the H-ALPHA CHROMOSPHERE of the sun, as seen through an H-alpha filter, occurring near strong SUNSPOTS and PLAGE or in FILAMENT channels.

FILAMENT. A mass of gas suspended over the PHOTOSPHERE by magnetic fields and seen as dark lines threaded over the solar DISK. A filament on the LIMB of the sun seen in emission against the dark sky is called a PROMINENCE.

FILAMENT CHANNEL. A broad pattern of FIBRILS in the CHROMOSPHERE, marking where a FILAMENT may soon form or where a filament recently disappeared.

FLARE. A sudden eruption of energy on the solar DISK lasting minutes to hours, from which radiation and particles are emitted.

fMIN. The lowest radiowave frequency that can be reflected from the IONOSPHERE.

foEs. The maximum ORDINARY MODE radiowave frequency capable of reflection from the SPORADIC E REGION of the IONOSPHERE.

foF2. The maximum ORDINARY MODE radiowave frequency capable of reflection from the F2 REGION of the IONOSPHERE.

FORBUSH DECREASE. An abrupt decrease, of at least 10%, of the background galactic COSMIC RAY intensity as observed by neutron monitors.

GAMMA. A unit of magnetic field intensity equal to 1 x 10.0E-05 GAUSS, also equal to 1 NANOTESLA.

GAMMA RAYS. High energy radiation (energies in excess of 100 keV) observed during large, extremely energetic solar FLARES.

GAUSS. The unit of magnetic induction in the cgs (centimeter-gram-second) system.

GEOMAGNETIC ELEMENTS. The components of the geomagnetic field at the surface of the earth. In SESC use, the northward and eastward components are often called the H and D components, where the D component is expressed in gammas and is derived from D (the declination angle) using the small angle approximation.

GEOMAGNETIC FIELD. The magnetic field observed in and around the earth. The intensity of the magnetic field at the earth's surface is approximately 0.32 gauss at the equator and 0.62 gauss at the north pole.

GEOMAGNETIC STORM. A worldwide disturbance of the earth's magnetic field, distinct from regular diurnal variations.

Minor Geomagnetic Storm: A storm for which the Ap index was greater than 29 and less than 50.

Major Geomagnetic Storm: A storm for which the Ap index was greater than 49 and less than 100.

Severe Geomagnetic Storm: A storm for which the Ap index was 100 or more.

Initial Phase: Of a geomagnetic storm, that period when there may be an increase of the MIDDLE-LATITUDE horizontal intensity (H).

Main Phase: Of a geomagnetic storm, that period when the horizontal magnetic field at middle latitudes is generally decreasing.

Recovery Phase: Of a geomagnetic storm, that period when the depressed northward field component returns to normal levels.

GEOSYNCHRONOUS. Term applied to any equatorial satellite with an orbital velocity equal to the rotational velocity of the earth. The net effect is that the satellite is virtually motionless with respect to an observer on the ground.

GMT. Greenwich Mean Time. (See COORDINATED UNIVERSAL TIME.)

GRADUAL COMMENCEMENT. The commencement of a geomagnetic storm that has no well-defined onset.

GRANULATION. Cellular structure of the PHOTOSPHERE visible at high spatial resolution.

GREEN LINE. The green line is one of the strongest (and first-recognized) visible coronal lines. It identifies moderate temperature regions of the CORONA.

Greenwich Mean Time. See COORDINATED UNIVERSAL TIME.

GROUND-LEVEL EVENT (GLE). A sharp increase in ground-level COSMIC RAY count to at least 10% above background, associated with solar protons of energies greater than 500 MeV. GLEs are relatively rare, occurring only a few times each SOLAR CYCLE.

H-ALPHA. This ABSORPTION LINE of neutral hydrogen falls in the red part of the visible spectrum and is convenient for solar observations. The H-alpha line is universally used for patrol observations of solar flares.

H-component of the Geomagnetic Field. See GEOMAGNETIC ELEMENTS.

HIGH FREQUENCY (HF). That portion of the radio frequency spectrum between between 3 and 30 MHz.

HIGH LATITUDES. With specific reference to zones of geomagnetic activity, "high latitudes" refers to 50o to 80o geomagnetic.

HIGH-SPEED STREAM. A feature of the SOLAR WIND having velocities that are about double average solar wind values.

HOMOLOGOUS FLARES. Solar flares that occur repetitively in the same ACTIVE REGION, with essentially the same position and with a common

pattern of development.

HYDER FLARE. A FILAMENT-associated TWO-RIBBON FLARE, often occurring in spotless regions. The flare presumably results from the impact on the CHROMOSPHERE of infalling FILAMENT material.

INTERPLANETARY MAGNETIC FIELD (IMF). The magnetic field carried with the SOLAR WIND.

IONOSPHERE. The region of the earth's upper atmosphere containing a small percentage of free electrons and ions produced by photoionization of the constituents of the atmosphere by solar ultraviolet radiation at very short wavelengths (<1000 angstroms). The ionosphere significantly influences radiowave propagation of frequencies less than about 30 MHz.

IONOSPHERIC STORM. A disturbance in the F REGION of the IONOSPHERE, which occurs in connection with geomagnetic activity.

K CORONA. Of the white-light CORONA (that is, the corona seen by the eye at a total solar eclipse), that portion which is caused by sunlight scattered by electrons in the hot outer atmosphere of the sun.

K INDEX. A 3-hourly quasi-logarithmic local index of geomagnetic activity relative to an assumed quiet-day curve for the recording site. Range is from 0 to 9. The K index measures the deviation of the most disturbed horizontal component.

KELVIN. A unit of absolute temperature.

Kp INDEX. A 3-hourly planetary geomagnetic index of activity generated in Gottingen, Germany, based on the K INDEX from 12 or 13 stations distributed around the world.

LEADER SPOT. In a magnetically bipolar or multipolar SUNSPOT group, the western part precedes and the main spot in that part is called the leader.

LIGHT BRIDGE. Observed in white light, a bright tongue or streaks penetrating or crossing SUNSPOT UMBRAe. The appearance of a light bridge is frequently a sign of impending region division or dissolution.

LIMB. The edge of the solar DISK.

LIMB FLARE. A solar FLARE seen at the edge (LIMB) of the sun.

LOOP PROMINENCE SYSTEM (LPS). A system of loop prominences associated with major FLARES.

LOW FREQUENCY (LF). That portion of the radio frequency spectrum from 30 to 300 kHz.

M 3000. The optimum HIGH FREQUENCY radio wave with a 3000 km range, which reflects only once from the IONOSPHERE (single hop transmission).

MAGNETIC BAY. A relatively smooth excursion of the H (horizontal) component (see GEOMAGNETIC ELEMENTS) of the geomagnetic field away from and returning to quiet levels.

MAGNETOGRAM. Solar magnetograms are a graphic representation of solar magnetic field strengths and polarity.

MAGNETOPAUSE. The boundary layer between the SOLAR WIND and the MAGNETOSPHERE.

MAGNETOSPHERE. The magnetic cavity surrounding the earth, carved out of the passing SOLAR WIND by virtue of the GEOMAGNETIC FIELD, which prevents, or at least impedes, the direct entry of the solar wind PLASMA into the cavity.

MeV. Mega (million) electronvolt. A unit of energy used to describe the total energy carried by a particle or photon.

MEDIUM FREQUENCY (MF). That portion of the radio frequency spectrum from 0.3 to 3 MHz.

MICROWAVE BURST. A radiowave signal associated with optical and/or X-ray FLAREs.

MIDDLE LATITUDES. With specific reference to zones of geomagnetic activity, "middle latitudes" refers to 20 deg. to 50 deg. geomagnetic.

MOUNT WILSON MAGNETIC CLASSIFICATIONS.

Alpha. Denotes a unipolar SUNSPOT group.

Beta. A sunspot group having both positive and negative magnetic polarities, with a simple and distinct division between the polarities.

Beta-Gamma. A sunspot group that is bipolar but in which no continuous line can be drawn separating spots of opposite polarities.

Delta. A complex magnetic configuration of a solar sunspot group consisting of opposite polarity UMBRAe within the same PENUMBRA.

Gamma. A complex ACTIVE REGION in which the positive and negative polarities are so irregularly distributed as to prevent classification as a bipolar group.

NANOTESLA (nT). A unit of magnetism 10.0E-09 tesla, equivalent to a gamma (10.0E-05 gauss).

NEUTRAL LINE. The line that separates longitudinal magnetic fields of opposite polarity.

PENUMBRA. The SUNSPOT area that may surround the darker UMBRA or umbrae. It consists of linear bright and dark elements radial from the sunspot umbra.

PERSISTENCE. Continuation of existing conditions. When a physical parameter varies slowly, the best prediction is often persistence.

PHOTOSPHERE. The lowest layer of the solar atmosphere; corresponds to the solar surface viewed in WHITE LIGHT. SUNSPOTs and FACULAe are observed in the photosphere.

PLAGE. An extended emission feature of an ACTIVE REGION that exists from the emergence of the first magnetic flux until the widely scattered remnant magnetic fields merge with the background.

PLAGE CORRIDOR. A space in chromospheric (see CHROMOSPHERE) PLAGE lacking plage intensity, coinciding with polarity inversion line.

PLASMA. Any ionized gas, that is, any gas containing ions and electrons.

POLAR CAP ABSORPTION (PCA). An anomalous condition of the polar IONOSPHERE whereby HF and VHF (3 - 300 MHz) radiowaves are absorbed, and LF and VLF (3 - 300 kHz) radiowaves are reflected at lower altitudes than normal. In practice, the absorption is inferred from the proton flux at energies greater than 10 MeV, so that PCAs and PROTON EVENTs are simultaneous. Transpolar radio paths may still be disturbed for days, up to weeks, following the end of a proton event.

POST-FLARE LOOPS. A LOOP PROMINENCE SYSTEM often seen after a major TWO-RIBBON FLARE, which bridges the ribbons.

PROMINENCE. A term identifying cloud-like features in the solar atmosphere. The features appear as bright structures in the CORONA above the solar LIMB and as dark FILAMENTs when seen projected against the solar DISK.

PROTON EVENT. By definition, the measurement of at least 10 protons/sq.cm/sec/steradian at energies greater than 10 MeV.

PROTON FLARE. Any FLARE producing significant FLUXes of greater-than-10 MeV protons in the vicinity of the earth.

QUIESCENT PROMINENCE (FILAMENT). Long, sheet-like prominences nearly vertical to the solar surface.

QUIET. A descriptive word specifically meaning geomagnetic levels such that Ap < 8 (see Ap INDEX).

RADIO EMISSION. Emissions of the sun in radio wavelengths from centimeters to dekameters, under both quiet and disturbed conditions.

Type I. A noise storm composed of many short, narrow-band bursts in the metric range (300 - 50 MHz).

Type II. Narrow-band emission that begins in the meter range (300 MHz) and sweeps slowly (tens of minutes) toward deka-meter wavelengths (10 MHz). Type II emissions occur in loose association with major FLAREs and are indicative of a SHOCK wave moving through the solar atmosphere.

Type III. Narrow-band bursts that sweep rapidly (seconds) from decimeter to dekameter wavelengths (500 - 0.5 MHz). They often occur in groups and are an occasional feature of complex solar ACTIVE REGIONs.

Type IV. A smooth continuum of broad-band bursts primarily in the meter range (300 - 30 MHz). These bursts are associated with some major flare events beginning 10 to 20 minutes after the flare maximum, and can last for hours.

RECURRENCE. Used especially in reference to the recurrence of physical parameters every 27 days (the rotation period of the sun).

RIOMETER (Relative Ionospheric Opacity meter). A specially designed radio receiver for continuous monitoring of COSMIC NOISE. The absorption of cosmic noise in the polar regions is very sensitive to the solar low-energy cosmic ray flux.

SECTOR BOUNDARY. In the SOLAR WIND, the area of demarcation between sectors, which are large-scale features distinguished by the predominant direction of the interplanetary magnetic field, toward or away from the sun.

SHORT WAVE FADE (SWF). A particular ionospheric solar flare effect under the broad category of sudden ionospheric disturbances (SIDs) whereby short-wavelength radio transmissions, VLF, through HF, are absorbed for a period of minutes to hours.

SMOOTHED SUNSPOT NUMBER. An average of 13 monthly RI numbers, centered on the month of concern.

SOLAR COORDINATES.

Central Meridian Distance (CMD). The angular distance in solar longitude measured from the central meridian.

SOLAR CYCLE. The approximately 11-year quasi-periodic variation in frequency or number of solar active events.

SOLAR MAXIMUM. The month(s) during the SOLAR CYCLE when the 12-month mean of monthly average SUNSPOT NUMBERS reaches a maximum. The most recent solar maximum occurred in December 1979.

SOLAR MINIMUM. The month(s) during the SOLAR CYCLE when the 12-month mean of monthly average SUNSPOT NUMBERS reaches a minimum.

SOLAR SECTOR BOUNDARY (SSB). The apparent solar origin, or base, of the interplanetary SECTOR BOUNDARY marked by the larger-scale polarity inversion lines.

SOLAR WIND. The outward flux of solar particles and magnetic fields from the sun. Typically, solar wind velocities are near 350 km/s.

SPORADIC E. A phenomenon occurring in the E REGION of the IONOSPHERE, which significantly affects HF radiowave propagation. Sporadic E can occur during daytime or nighttime and it varies markedly with

latitude.

SUDDEN COMMENCEMENT(SC, or SSC for Storm Sudden Commencement). An abrupt increase or decrease in the northward component of the geomagnetic field, which marks the beginning of a GEOMAGNETIC STORM.

SUDDEN IMPULSE (SI+ or SI-). A sudden perturbation of several gammas in the northward component of the low-latitude geomagnetic field, not associated with a following GEOMAGNETIC STORM. (An SI becomes an SC if a storm follows.)

SUDDEN IONOSPHERIC DISTURBANCE (SID). HF propagation anomalies due to ionospheric changes resulting from solar FLAREs, PROTON EVENTs and GEOMAGNETIC STORMs.

SUNSPOT. An area seen as a dark spot on the PHOTOSPHERE of the sun. Sunspots are concentrations of magnetic flux, typically occurring in bipolar clusters or groups. They appear dark because they are cooler than the surrounding photosphere.

SUNSPOT GROUP CLASSIFICATION (Modified Zurich Sunspot Classification).

A - A small single unipolar SUNSPOT or very small group of spots without PENUMBRA.

B - Bipolar sunspot group with no penumbra.

C - An elongated bipolar sunspot group. One sunspot must have penumbra.

D - An elongated bipolar sunspot group with penumbra on both ends of the group.

E - An elongated bipolar sunspot group with penumbra on both ends. Longitudinal extent of penumbra exceeds 10 deg. but not 15 deg.

F - An elongated bipolar sunspot group with penumbra on both ends. Longitudinal extent of penumbra exceeds 15 deg.

H - A unipolar sunspot group with penumbra.

SUNSPOT NUMBER. A daily index of SUNSPOT activity (R), defined as R = k (10 g + s) where S = number of individual spots, g = number of sunspot groups, and k is an observatory factor.

SURGE. A jet of material from ACTIVE REGIONs that reaches coronal heights and then either fades or returns into the CHROMOSPHERE along the trajectory of ascent.

TWO-RIBBON FLARE. A FLARE that has developed as a pair of bright strands (ribbons) on both sides of the main inversion ("neutral") line of the magnetic field of the ACTIVE REGION.

TYPE I, II, III, IV. See RADIO EMISSION

U BURST. A fast radio burst spectrum of a FLARE. It has a U-shaped appearance in an intensity-vs.-frequency plot.

ULTRA HIGH FREQUENCY (UHF). Those radio frequencies exceeding 300 MHz.

UMBRA. The dark core or cores (umbrae) in a SUNSPOT with PENUMBRA, or a sunspot lacking penumbra.

UNIVERSAL TIME (UT). See COORDINATED UNIVERSAL TIME.

UNSETTLED. With regard to geomagnetic levels, a descriptive word specifically meaning that 7 < the Ap INDEX < 15.

VERY HIGH FREQUENCY (VHF). That portion of the radio frequency spectrum from 30 to 300 MHz.

VERY LOW FREQUENCY (VLF). That portion of the radio frequency spectrum from 3 to 30 kHz.

WHITE LIGHT (WL). Sunlight integrated over the visible portion of the spectrum (4000 - 7000 angstroms) so that all colors are blended to appear white to the eye.

WHITE LIGHT FLARE. A major FLARE in which small parts become visible in white light. Such flares are usually strong X-ray, radio, and particle emitters.

WOLF NUMBER. An historic term for SUNSPOT NUMBER. In 1849, R. Wolf of Zurich originated the general procedure for computing the sunspot number.

X-RAY BACKGROUND. A daily average background X-ray FLUX in the 1 to 8 angstrom range. It is a midday minimum designed to reduce the effects of FLAREs.

X-RAY BURST. A temporary enhancement of the X-ray emission of the sun. The time-intensity profile of soft X-ray bursts is similar to that of the H-ALPHA profile of an associated FLARE.

X-RAY FLARE CLASS. Rank of a FLARE based on its X-ray energy output. Flares are classified by the order of magnitude of the peak burst intensity (I) measured at the earth in the 1 to 8 angstrom band as follows:

Class (in Watt/sq. Meter)

B I < 10.0E-06

C 10.0E-06 <= I <= 10.0E-05

M 10.0E-05 <= I <= 10.0E-04

X I >= 10.0E-04

ZURICH SUNSPOT CLASSIFICATION. A sunspot classification system that has been modified for SESC use.

Report of Solar and Geophysical Activity

Part IA
This first part contains a general description of significant solar features and activity observed during the 24 hours ending at 2100Z. This discussion includes characteristics of sunspots, plages, magnetic fields, active filaments, limb and flare activity and other phenomena (such as x-ray and radio bursts) associated with significant solar activity.

Part IB
A discussion of the potential for solar activity during the next 3 days. Solar regions expected to rotate onto the visible solar disk during this period are noted. The Sun rotates aproximately once every 27 days.

Part IIA
This part contains a brief description of significant geophysical activity observed during the 24 hours ending at 2100Z. This includes polar cap absorption (PCA) events, satellite level particle (protons and alpha particles) enhancements and a general description of the planetary geomagnetic activity.

Part IIB
This is a forecast of significant geophysical activity for the next 3 days.

Part III
Numerical predictions of significant solar and geophysical phenomena for the next 3 days:

(a) CLASS M: Daily forecast of the probability of occurrence of one or more Class M x-ray events.
(b) CLASS X: Daily forecast of the probability of occurrence of one or more Class X x-ray events.
(c) PROTON: Daily forecast of the probability of occurrence of a flare that will cause a significant proton event (at least 10 protons/sqcm/sec/ster at energies greater than 10 MeV).
(d) PCAF: A 24-hour forecast of a significant polar cap absorption (PCA) event (at least 2.0 dB absorption in sunlight or at least 0.5 dB absorption in darkness, on a riometer located in the polar cap). These forecasters are issued as a "color-coded" Polar Cap Absorption Forecast (PCAF) as follows:
1. PCAF GREEN - No active region exists on the Sun likely to produce a PCA event in the next 24 hours.
2. PCAF YELLOW - A region which possess characteristics favorable for producing a PCA event is present on the Sun. If an ener-

getic flare event occurs in this region, the probability of a significant PCA event resulting is very high.
3. PCAF RED - An energetic solar event has occurred or a proton event has been observed at satellite altitudes and there is a high probability that a significant PCA event will result within the next 24 hours.

NOTE: If a significant PCA event is in progress, at forecast time, the statement, "IN PROGRESS" will be used.

Part IV
A part containing observed and forecast values of the 10.7cm solar radio flux.

(a) OBSERVED: Previous day's 10.7cm solar radio flux observed at 1700Z at the Algonquin Radio Observatory near Ottawa, Canada.
(b) PREDICTED: Daily forecasts of the 10.7cm flux for the next 3 days.
(c) 90-DAY MEAN: The 90-day mean of the observed 10.7cm flux.

Part V
This part contains the observed, estimated and predicted values of daily geomagnetic indices.

(a) OBSERVED AFR/AP: The observed daily geomagnetic A-index for Fredericksburg, Virginia (AFR) and the observed daily planetary geomagnetic index (AP) for the day indicated.
(b) ESTIMATED AFR/AP: For the day indicated, an estimate of the daily geomagnetic A-index (AFR) for Fredericksburg, Virginia and an estimate of the planetary geomagnetic index (AP).
(c) PREDICTED AFR/AP: Predictions of the daily geomagnetic A-index for Fredericksburg and the planetary geomagnetic index for the next 3 days.

When implemented, an Abbreviated Solar-Geophysical Glossary will be available on this bulletin board to help those who are unfamiliar with the terms used above. In the interim, users are directed to the references mentioned in Help File 2.

1346. Re: sw stations on am

Newsgroup: rec.ham-radio
Date: 1989-06-21 15:21:19 UTC
From: dya@unccvax.UUCP
Message-ID: <1531@unccvax.UUCP>
Source record: 18269

In article <43f35562.d2d6@apollo.COM>, stuart@apollo.COM (Stuart Troutman) writes:
> Why am I receiving international shortwave stations on the
> AM dial? In the last three or four months, I find signals
> coming through clearly on three different oridinary AM
> receivers. Just past 1600Khz, I can clearly pick up the
> BBC World Service, die Deutsche Welle, a French broadcast

Ordinary AM radios with a 455 kHz IF use high side
injection for their local oscillator, but even a Radio Slack
$6.95 portable should have better image rejection than this.
Besides, the frequencies involved (1440 to 2510 kc) aren't
generally used for broadcasting, are they?

If you can receive WRKO (680 kc) in Boston on 1590,
the receiver has a lousy image response.

The **usual** mode for something like this at the
high end of the dial seems to be in AM-FM receivers of
relatively poor design. In your cheapo AM-FM set, the
IF amplifiers are designed in such a way that they have
two passbands, one at 455 kHz, the other at the standard
FM IF of 10.7 mHz. Usually, a judiciously placed finger
at the first mixer of the FM stage (disabling the local
oscillator) will usually bring forth shortwave stuff.

It is not inconceiveable that there be significant
downconversion of 10 mHz signals to the 455 kHz IF, but I'll
probably be proved wrong, as the sets involved are AM only,
right? In that case, I don't know what the mode is.

Three signal intermodulation in certain places in
Boston would explain it (say, a local carrier at a few
Mhz, or the RFI sewer running roughly along Mass 9, starting
at Ashland and continuing past Needham Heights). However,
you took the receiver 40 miles away.

Now, a question for the Net. My clients who have
AM stations on the lower end of the dial (say, less than
1070 kHz) complain constantly about a pheonomenon which I
have heard in North Carolina mabye ten times. This is
a signal which has time ticks like WWV, a burst of 400 Hz
Morse every minute, and then some man (once I heard a woman)
speaks an unintelligible foreign language which might be
Spanish. The signal is never really strong (say, 100-300
uV/m) but is extremely annoying to certain nighttime clients
with 50 watts PSSA, etc. (Note that this is not the same

pheonomenon as the 2 megawatt Cuban station on 830 kc, which
last month was playing Simple Minds and delivering about
5-8 mV/m skywave at my home in Concord, NC...). The 2 megawatts
is an estimate....

I'm curious as to what those signals are...

How about the KA9Q tcp/ip package and running a SLIP link between the two?
See rec.ham-radio.packet for details or info on anonymous FTP sites for the
code. You can also get it from TAPR in Tucson.

1348. Re: 10 and 11 codes

Newsgroup: rec.ham-radio
Date: 1989-06-21 19:02:47 UTC
From: tab@cbnewsm.ATT.COM
Message-ID: <986@cbnewsm.ATT.COM>
Source record: 18271

(I sent mail to Phil; I'm posting in case anyone else is interested...)

In Message-ID: <25989@amdcad.AMD.COM> Phil Ngai asks:
> I've noticed our local police department uses 11 codes as well as 10
> codes. [...]

Jim.Grubs@f1.n234.z1.fidonet.org (Jim Grubs) responds:
>I used to be a police dispatcher 23 years ago. I know of no 11 codes, but that
>doesn't prove anything. Local police are free to designate their own codes.
>Even the conventional 10 codes need not necessarily have the same meaning
>everywhere. [...]

In my experience, only a few of the 10 codes are the same across several different towns, and the ones our town uses aren't even close to any published list that I've seen (10-4 doesn't seem to change, though). One town that I know of has 10 codes going all the way up to something like 10-72!

As for the "11 codes", some towns use codes for personnel, vehicles, and/or locations -- listen to the context to see if this is the case. It might be that they have different prefixes for police, fire, and ambulance units (i.e., 11-123 might be a police car, 12-123 a fire engine, etc.). Some counties or states may have prefixes or even entirely different numbering systems for these things than towns use internally, so if the "11 codes" are only used occasionally, this may be why.

What if volunteer firefighters didn't volunteer?

1349. Good portable SW recvr?

Newsgroup: rec.ham-radio
Date: 1989-06-21 19:10:41 UTC
From: rodman@mfci.UUCP
Message-ID: <910@m3.mfci.UUCP>
Source record: 18127

Due to strange twists of fate I happened to be in Beijing from late May to June 6th. Luckily one of us had a small SONY SW recvr which was wonderful. I have resolved never to travel out of the US without one.

Could folks send me their opinions on the various portable SW radios available? I confess to some ignorance on the subject of portable SWL'ing radios. I'm interested in something good, (I'm used to my ic735, after all) but small size is useful too. A pointer to a good review article would be nice. Expected prices also useful!

Thanks in advance! I'll post a summary....

Message-ID: <8906221808.AA05478@ucbvax.Berkeley.EDU>
Source record: 18275

As previously discussed, WWV broadcasts a brief summary of shortwave propagation conditions at 18 minutes past each hour. This information is also available as a recorded message from (303) 497-3235.

Much more extensive forecast data are available from the NBS Space Environment Services Center's public BBS at (303) 497-5000. Modem settings are 1200,N,8,1. Access is free, except for the toll charge. One of the available reports is a three-day forecast of conditions. (I hope they're wrong about Field Day conditions.) Lest anyone doubt the contributions of hams to the understanding of propagation, QST is mentioned several times in the online help! I downloaded some sample reports and all the help text and will be happy to email same to anyone requesting, to save you some telephone $'s.

Thanks to Tom (N0GOS) and Greg (KG6YV) for the BBS info.

I am looking for the addresses for parts for Regency Scanners.
I have a MX-3000 I need a volume control for. None of the local parts
houses seem to be able to come up with one, so I need to get one
from Regency. I used to have a phone number and address for a place in
Florida, but that doesn't seem to be any good anymore. I guess with
everyone buying everyone else, thes service centers all change.

Anyone with any help would be greatly appreciated. Please E-mail
your responses if you can.

Thanks and 73,
Michael

Taxis on 10 meters in New York - possible solutions are:

1) Fight back! I wonder how they would respond to a kilowatt of RTTY
hitting them. (or a kilowatt of FM/CW/SSB?) Most 'users' of such gear
are non-technically-competent, and wouldnt be able to differentiate
between the sounds of SSB over the top of them and an equipment
malfunction. Slowscan TV coming out of an FM radio can sound WONDERFUL!
What about a 'propagation study beacon' on their calling frequency,
or does the FCC enforce the bandplan better than they enforce the
licensing laws? Surely they can't forbid 'tuning up' your antennas/linears?

2) Mislead them. Find the language they are using, and direct them to the
wrong addresses, tell their base that they have broken down, or anything
else thats likely to put them off. They will either give up and choose
another frequency, or come and burn your house down.

OK neither of the above are particularly ethical, but since 'they' are there
illegally, 'they' cant really object if you use 'reasonable force' to
remove them. Remember, YOU are LICENSED to transmit, they arent!
We here in the UK had similar experiences with illegally
converted CB's in the bottom part of 10 meters some years ago, and also
with illegal cordless phones on 70MHz (a UK allocation to hams) and found
that persistent SSB or CW usually eliminated these pests.
If threatened with personal violence, take out an injunction against
the people concerned (both to prevent harassment and to cease operating
on 10 meters without a license).

As an alternative to (nearly) avoid HV oil caps, is there any
reason why a switching power supply could not be made to step up
the rectified and filtered line voltage to 2 or 3 KV?

I have seen lots of switching designs for low voltage, high current
supplies for digital electronics but I've never seen this approach
in ham circles for high voltage tube supplies.

What I have in mind is to directly rectify the 110 or 220 line voltage
and filter this to a constant dc with caps rated at 200 or 400
volts rather than 2KV. Then, use power MOSFETS to drive a homemade
transformer at say, 20KHz in a dc/dc converter. The stepped up 20KHz ac
is again rectified and filtered at the high voltage. The cap here need
only filter out 40KHz pulses rather than 120Hz pulses and
thus can be some 300 times smaller. I've seen MOSFETS for 400V at
10A so this is possible.

Also, this approach avoids the 100lb, expensive 1KW transformer. At
20 KHz, a torroidal ferrite like Amidon sells could be used (i.e. the
big T200 sizes). These run about $10 or $20 as I recall.

Is there a problem here? (Com'on all you homebrew advocates!)

York David Anthony replies:

>Ordinary AM radios with a 455 kHz IF use high side
>injection for their local oscillator, but even a Radio Slack
>$6.95 portable should have better image rejection than this.
>Besides, the frequencies involved (1440 to 2510 kc) aren't
>generally used for broadcasting, are they? ...

Maybe the local oscillator has high harmonic content, resulting in conversion of multiple frequencies.

SUPER-CHEAP 2.5 MHz WWV RECEIVER

This is a useful project as well as a good lecture-demonstration of the superheterodyne principle and image-response.

Materials:

One typical 6-transistor AM-broadcast receiver (from K-Mart, garage sale, etc.)

One RF signal generator (I use the local oscillator of a digitally-tuned communications receiver; no direct coupling is required.)

Conversion:

1. Tune the radio to 1590 kHz, which puts the local oscillator 2045 kHz, which is 455 kHz below 2.5 MHz.

2. Remove turns from the main antenna coil until it resonates at 2.5 MHz.

3. Tweak the trimmers on the back of the tuning capacitor for best reception.

The converted receiver is suitable only for WWV or other fixed frequency, since the antenna and local-oscillator tuning no longer track properly.

In continental U.S. east of the Mississippi River, WWV at 2.5 MHz can usually only be received at night. To enhance reception, add an

external long-wire antenna coupled to the ferrite rod by a few turns,
thence to earth ground.

Posted at Tad's request, as part of a discussion on the practicality of sending TV pictures from model airplanes. A challenging job, but one that sounds intriguing!

From uunet!amc-gw!ssc!tad Wed Jun 21 00:40:24 1989
Subject: ATV/RC
Date: Sat Jun 17 13:28:33 1989

Mike:

I read your message about video from model planes. I talked to someone awhile back who has done it! Last year at work I was talking to some folks at Matsushita (Panasonic) in New Jersey. One fellow I talked to had built a large plane, and installed an extremely small color CCD camera in the belly. The camera was one custom built for him by an engineer at Matsushita. He did not have a ham license, so he built a low power UHF channel operating on a locally unused UHF TV channel. He claimed that it worked great. At the time I spoke with him, he was working on getting his ham license so that he could operate the thing legally on ham frequencies.

Also, when I was in Vancouver a few years ago for the world's fair, I met a commercial pilot that was involved in a commercial venture doing work like this for the U.S. government. They built tiny CCD cameras that went inside small radio controlled planes, and were used for aerial recon. He showed me several photos and data sheets for their products. Real interesting stuff.

1360. Re: 10 and 11 codes

Newsgroup: rec.ham-radio
Date: 1989-06-22 17:29:14 UTC
From: brian@ucsd.EDU
Message-ID: <1776@ucsd.EDU>
Source record: 18137

The 11 codes are rather popular here in SoCal; if you remember watching TV programs like Dragnet and Adam-12 you'd have heard them. There are far too many for me to type them in even if I did remember them, but I know that they're published in several of the scanner books like "Police Call" and suchlike. Visit your local ham radio or CB store - and I'll bet you can find a list in some Radio Schlock publication.

A few of the local ones stick with me from the days when I used to have the graveyard shift:
11-8 person down
11-10 take a report
11-11 animal loose in the street
11-30 person calling for help
11-31 incomplete phone call
11-40 ambulance call
11-44 dead body
11-45 suicide
11-80 serious injury traffic accident
11-81 minor injury traffic accident
11-82 non injury traffic accident
11-85 tow truck needed
11-99 officer needs help

One thing to note is that police codes are not secret really, since every patrol car has a list; if you've got a friend with the department he can probably liberate one of the code cards for you. Some departments even will give them out if you take a tour of the station.

Supposedly the original use for codes of this sort was to reduce the amount of radio traffic; to some extent that's still true. Part of it is the secret-society jargon aspect; only those in-the-know will have the secret lodge pin and handshake. Part of it is just habit; there are few organisations more conservative and hidebound than the police.

Be careful chasing police cars. As a news supervisor once told me: "Most policemen are disillusioned romantics. After you weed out the bullies, what you have is a group of people who once thought they could make a difference. Most of them now know better, but still can't admit it to themselves. And after a lifetime of dealing with a criminal element every day, they often come to believe that anyone not in uniform must be a criminal. Treat them accordingly, and they probably won't shoot you. But remember, no matter how right you are, he's got the gun and you've only got a camera - and no one on the local force has ever been prosecuted for killing someone, in the line of duty or not."

1364. Cordless Phones & Privacy -- legal decision

Newsgroup: rec.ham-radio
Date: 1989-06-22 19:01:38 UTC
From: wmartin@ST-LOUIS-EMH2.ARMY.MIL
Message-ID: <8906230725.AA16311@ucbvax.Berkeley.EDU>
Source record: 18134

In the Wednesday, 21 June, St. Louis Post-Dispatch, on page B1 (first page of the editorial section):

REACH OUT, TAP SOMEONE
Court Overrules Privacy On Cordless Telephones

by Tim Bryant

Is the privacy of your telephone conversation protected by federal law? Not if you are using a cordless phone.

The 8th US Circuit Court of Appeals has ruled that the 21-year-old Omnibus Crime Control Act does not prohibit interception of cordless phone conversations.

In a unanimous opinion, a three-judge appellate panel said: "Courts have not accepted the assertions of privacy expectation by speakers who were aware that their conversation was being transmitted by cordless telephone."

The appeals court ruling, handed down last week in St. Louis, arose from a case in Iowa in which criminal charges were filed against a man who had been unaware that a family four blocks from his house was listening to his conversations over his cordless phone.

The man, Scott C. Tyler, filed a civil suit over the matter and said that he would press his case to the Supreme Court, if necessary.

"It's been a five-year battle, and this is not over by any means," Tyler said.

Tyler, 44, of Dixon, Iowa, spent 123 days in prison on two theft convictions in Iowa. Authorities said Tyler had set up a dummy company to bilk two food distributors out of $35,000 in goods.

The case began in 1983 when Richard and Sandy Berodt, who lived four blocks from Tyler and his family, discovered that their cordless phone was picking up conversations from the Tylers' cordless phone.

"Based on what they overheard, the Berodts suspected Scott Tyler of criminal activity," the appeals court said in its opinion.

The Berodts called the Scott County Sheriff's Department in Davenport, Iowa, and were asked to continue eavesdropping on the Tylers. Although no court order was obtained, the Berodts tape-recorded some of the conversations with equipment that Tyler said the sheriff's department had provided.

A jury convicted Tyler of theft, even though the judge refused to allow the recordings as evidence.

In July 1985, Tyler and four members of his family filed a damage suit against the Berodts, Scott County, the sheriff and a deputy. US District

Judge Harold D. Vietor of Des Moines, Iowa, ruled against the Tylers, saying that federal wiretap laws, the 1968 crime control act and the Fourth Amendment's protection against unreasonable searches and seizures did not apply to cordless phone transmissions.

Scott County Prosecuting Attorney Thomas C. Fritzsche said he agreed with Vietor's decision. He added that the appeals court's ruling puts the 8th Circuit "in the mainstream" of recent decisions involving cordless phones.

"What gave Mr. Tyler some type of credibility was that there has been a split in the case law that has looked at this type of case," Fritzsche said. "But a whole recent trend of opinions has been away from that type of decision. All the courts -- and there have been three or four of them -- have gone the other way.

"Mr. Tyler has ideas that this is a case of burning social issues. It really isn't."

Tyler had relied on a case that the 9th US Court of Appeals decided in 1973. In that case, telephone conversations were disallowed as evidence when at least one participant in a phone call used an ordinary phone line.

But among the cases that the 8th Circuit cited in its ruling against Tyler was a 1970 case involving former Teamsters union boss Jimmy Hoffa. In that instance, the 7th US Circuit Court of Appeals said there was no "expectation of privacy" for conversations over a mobile telephone.

In a footnote to its opinion, the appeals court here said that the 1986 overhaul of federal wiretap laws had changed the definition of wire communications to say that "such term does not include the radio portion of a cordless telephone [call] that is transmitted between the cordless telephone handset and the base unit."

"As a matter of federal law, we do not believe the Tylers had a justifiable expectation of privacy for their conversations," the court said.

Tyler said it was time for the law to catch up with technology.

"Everybody is going to be walking around with a pocket phone in the next five to ten years," he said. "The Fourth Amendment needs to be extended."

He said his cordless phone had been a Father's Day gift.

"Little did I know it would cause five years of hell in my life," he said.

Judges George G. Fagg of Des Moines, Gerald W. Heaney of Duluth, Minn., and Frank J. Magill of Fargo, N. D., issued the opinion.
End of Article

[There is also a sidebar item telling what a cordless phone is. I won't bother typing that in; people here know that... :-) It does mention that "modern cordless phones are equipped to use 10 channels ... Each channel has a digital security code that can be programmed 256 different ways. The result is a 2560-to-1 chance that two cordless phones with channels

programmed the same way will be within each other's broadcast range..."
That calculation of probability sounds a bit specious to me, but I'll leave the rebuttal up to others for now... -WM]

One last comment -- I find it surprising that the article does NOT mention the ECPA in any way. Of course, the court case has to be based on law in effect at the time, but the ECPA has changed things since then, and I would have thought that the writer and editor would have wanted to bring that point out...

Regards, Will Martin

1365. Re: Kantronics Monobanders Discontinued

Message-ID: <639@aurora.AthabascaU.CA>
Source record: 18142

I think there is some confusion as to what the cutback involves,
and how the CBC services relate to each other.

There are six major (and fairly independent) services:

English Television
French Television
English Radio (AM)
French Radio (AM)
CBC Stereo (FM)
Radio Canada (RCI shortwave)

Of these, CBC Stereo is a completely "network" service. There are no
locally originated broadcasts (other than weather and maybe PSA's).

English Radio is primarily a network service. Local broadcasts originate
three times per day: 0530-0900, 1200-1400, and 1600(?)-1800. Some
regional programming takes place on the weekends, and there are local
news, weather, and PSA's at various times throughout the programming
day.

English Television runs network programming during weekday prime time
and during the weekends (mostly for sports). The remaining TV is either
locally or regionally programmed.

RCI is its own entity, and originates its own programming. It borrows
from the national news service, and from the English Radio network
(As It Happens, etc). It might tap the French services as well - I'm
not sure about this.

I can't say much about how the French services operate, however my
impression is that French Television is very network oriented.

I haven't included the new all-news cable channel, since it is not yet
operational, and might not be if the cutbacks go through.

Each of the services has to fight for it's own piece of the national
CBC budget. There's a lot of infighting as a result, although CBC Stereo
and English Radio get along quite well. (They share staff, facilities,
and programming as it is, so ...)

Of all the services, English Television will be hit the hardest. They
had planned to increase their Canadian content to 95% over the next
few (five?) years. Doing this is going to require a LOT of money, and
they have already started reallocating funds internally to support it.
Having their funding cut now will leave them in a very messy position.
(I won't go into the details as I want to get my facts together first,

and it would deserve a seperate posting anyway.) What it boils down to is English Television is going to fight like mad for every penny they can get. If that means taking out RCI (or anyone else), so be it. Since RCI has such low visibility (especially within the country) it is a prime target.

As for RCI becoming the national radio service, I cannot see this happening. RCI's mandate is very different than the English Radio network's. RCI is there to promote Canada to the world, and to keep Canadians abroad up to date with what's happening at home. The English Radio service lets Canadians know what's happening in the rest of the world, and provides an outlet for programming that is a bit more intellectually oriented than your average top 40 AM station :-) The difference is very hard to describe in words: you have to experience CBC Radio to really understand what it's all about.

Finally, there's an even more important reason why RCI won't replace English Radio: upgrading RCI with new transmitter sites would require CAPITAL DOLLARS. Right now the CBC has NO capital dollars. It sure as hell won't get any if the cutback goes through. [Victoria, B.C. was promised English Radio service *how* *many* years ago?]

So what's this got to do with rec.ham-radio? Anyone catch the openings on six last week? :-)

Yes, some taxi services illegally use our 10 meter band for their services.
It just goes to prove that laws without enforcement are useless.
The FCC is working with limited funds. It has been for many years. You can
blame Ronnie Ray-gun for cutting their budget even further.

Well, I guess if the present trends continue, you can kiss Amateur Radio a fond
farewell. Just as many residential areas of some cities have been overtaken
by crime and pollution, so will Amateur Radio.

Sure, the FCC knows that these (and MANY other) illegal operations take place,
they could probably care less. Do hams lose any money ($$) if taxis use 10
meters?? Of couse not! So where's the problem?? City police officers are well
aware of drug dealers and "crack" houses, and do little or nothing to stop the
illegal activities, the same way the FCC ignores illegal radio operations.

Oh! Don't forget that the air waves are "free for all"! Does anyone remember
the mail I use to get from Mr. Raghu K, the bootlegger who said I was crazy for
letting silly LAWS dictate my operating habits.

Maybe we all are fools for believing those silly rules. If they aren't
enforced, then they are as good as nothing!

I view the present illegal radio operations the same way an old man would view
his old neighborhood -- the one he helped build -- the one he grew up in --
Now filled with drug dealers, prostitutes, and other filth.

> far too many for me to type them in even if I did remember them, but I
> know that they're published in several of the scanner books like "Police
> Call" and suchlike.

Some law enforcement agencies use "Signal" codes (instead of "11"
codes) to augment the 10 codes. Examples from one such agency are:

Signal 1 Auto accident
Signal 1A Auto accident, injury
Signal 1B Auto accident, fatal
Signal 2 Intoxicated person
Signal 2A Intoxicated driver
Signal 3 Stolen vehicle
...
Signal 30 Checking out vehicle

In many cases even the "signal" will omitted, with just the number
used with full understanding (e.g., "Radio to 82, you have a 1A at ...").

> One thing to note is that police codes are not secret really, since
> every patrol car has a list; if you've got a friend with the department
> he can probably liberate one of the code cards for you.

In the days when my wife was a police officer, everyone was
expected to KNOW the signal codes, and I don't ever recall seeing a
list in any marked or unmarked vehicle.

As an amusing aside, my wife once related a story. It seems that
there was a rookie officer on lone patrol who was dispatched to a Signal 13,
which is a "completed" suicide. The rookie, thinking that a Signal 13 was
just some type of accident or injury radioed back before responding to
the call, "Is it a _serious_ Signal 13?" Some of you may not find this
amusing, but the people on the police department sure did!

1369. MFJ-931 Artificial Ground

Newsgroup: rec.ham-radio
Date: 1989-06-23 12:33:45 UTC
From: ginsburg@ginosko.samsung.com
Message-ID: <1588@ginosko.samsung.com>
Source record: 18148

Has anyone out there used the MFJ-931 Artificial Ground box? I live on the third floor apartment of a very old house and am left with few alternatives for producing a decent ground, namely cold water pipes (I'd like to avoid this) or running a wire down the side of the house to an earthbound copper rod. This artificial ground thing looks like a simple, clean solution to my ground problem. Can anyone provide me some feedback on it?

73,
Scott

>As previously discussed, WWV broadcasts a brief summary of
>shortwave propagation conditions at 18 minutes past each
>hour.

WWVH, WWV's sister station in Hawaii has started broadcasting the propagation forcasts at 45 minutes after the hour. WWV and WWVH broadcast on the same frequencies. The time announcements on WWVH are in a female voice though.

The propagation information is the same for both stations.

I'm looking for any experiences people have had with the
Butternut "Butterfly" (HB..something) antenna. This is
the HF Beam antenna that looks like a bow-tie.

From a physical point of view it is really the only beam
antenna I could put up in my limited terrain.

Any experiences? How directional is it? How does it compare
with a good dipole or other beams? How does it hold up as
an urban antenna?

Many thanks

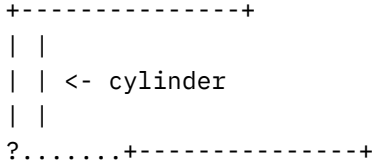
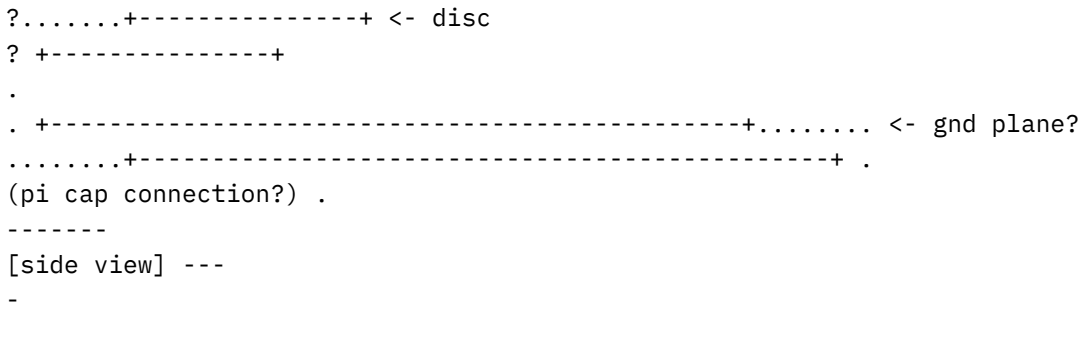
>foam spacers, and set the cylinder 2" above the disc on stryofoam spacers.

I havn't seen the "Electronic and Wireless World" artical, so I'm having
some difficulty with picturing this interesting "beast". From the
description above it seems to suggest this (looking at the side):





(I'm assuming also, that "sheathing board" is basically styrofoam with aluminum foil glued/fused to each side)

I'd like to experiment, also, but I'm not sure from the description how you have wired this. A crude diagram (like above) would help a lot, or even better, if someone could post one in PostScript code, for a laser printer.

What have your results been like, when the band is better? Or, how does this compare with your long wire/dipole/inverted vee? You mentioned it was "weak", so this suggests that it does not do quite as well (at least the "half" model).

>...Perhaps my observations will stimulate some others to do more
>experimenting on Crossed-Field Antennas.

You bet. On the surface at least, this sounds like a great new discovery (who says its all been done on HF already?!). Please keep us posted as you continue to use/experiment. It might be some time before I get a chance to -- besides you might save me some trouble :-) :-). But your work suggests that there is indeed something real to this-- the matching is encouraging, but of course the "radiated part" has to be further investigated.

Yes, I wondered why the hams in NYC dont start a RTTY net on 10M.
Or start using SSTV. Just think how wonderful it would be to
have a lot of activity on this band and with 1.5 KW signals to boot.
Of course code practice sessions would also be good for the novices
and others. With a little luck they can be driven up to six meters
and then the general population can complain that channel 2 is not
any good any more. But just pray these creeps dont figure out how
to use a 2 meter repeater!

Yes, it is quite illegal unless done on a HAM band (w/valid license).
Some people have tried to fly on a HAM freq w/o a license, and needless
to say they don't get off the ground.

There is a gentleman by the name of Eric, who flys a giant scale heli,
called 'The Bruiser', and he transmits to the ground via camcorder.
He has a valid HAM license too.

I have heard 11, 12, and 9 codes used in various areas that I have
visited. They are most definately not standardized.

Here is a list of the tencodes used in Utah:

Official Associated Public Safety Communications Officers
"Ten Signals"

10.0 Caution 10.51 Wrecker needed
10.1 Signal weak 10.52 Ambulance Needed
10.2 Signal good 10.53 Traffic control
10.3 Stop transmitting 10.54 Change to channel _____
10.4 Affirmative (OK) 10.55 Intoxicated driver
10.5 Relay (To) 10.56 Intoxicated pedestrian
10.6 Busy unless urgent 10.57 Hit and run (F, PI, PD)
10.7 Out of service 10.58 Airplane crash
10.8 In service 10.59 Reckless driver
10.9 Say again 10.60 Out of car on violator
10.10 Negative 10.61 Motor inspection
10.11 _____ on duty 10.62 Request permission car to car
10.12 Stand by 10.63 Prepare to make written copy
10.13 Existing conditions 10.64 Vandalism
10.14 Information 10.65 Juvenile problem
10.15 Message delivered 10.66 Major crime alert
10.16 Reply to message 10.67 Net message
10.17 Enroute 10.68 Runaway juvenile
10.18 Urgent 10.69 Missing person
10.19 In contact 10.70 Fire alarm
10.20 Location 10.71 Nature of fire
10.21 Call (_____) by phone 10.72 Progress report on fire
10.22 Disregard 10.73 Rape
10.23 Arrived at scene 10.74 Civil Disturbance
10.24 Assignment complete 10.75 Domestic problem
10.25 Report to _____ (Meet_____) 10.76 Meet complainant
10.26 Estimated time of arrival (ETA) 10.77 Return to _____
10.27 License/Permit information 10.78 Back up _____
10.28 Ownership information 10.79 Notify coroner
10.29 Records check 10.80 Chase in progress
10.30 Danger/Caution 10.81 Breatherlizer report
10.31 Pickup _____ 10.82 Prisoner in custody

10.32 _______ units needed 10.83 Confidential information
10.33 Help me quick 10.84 Visitors present
10.34 Time 10.85 Victims condition
10.35 A. Fair B. Poor
10.36 Security check C. Critical D. Possible fatality
10.37 Spotlighter E. Obvious fatality
10.38 Computer down 10.86 Crime in progress
10.39 Urgent use light and siren 10.87 Abandoned car
10.40 Silent run, no lights 10.88 Man with gun
10.41 Beginning tour of duty 10.89 Bomb threat
10.42 Ending tour of duty 10.90 Bank alarm at ______
10.43 Shuttle 10.91 Burglary
10.44 Permission to leave 10.92 Theft
10.45 Animal carcass at __________ 10.93 Unnecessary use of radio
10.46 Assist motorist 10.94 Contact your home
10.47 Investigate suspicious vehicle 10.95 Out at home
10.48 Disturbing the peace 10.96 Mental subject
10.49 Traffic light out at __________ 10.97 Test signal
10.50 Accident (F, PI, PD) 10.98 Prison break
10.99 Wanted/Stolen indicated

10-34 through 10-38 are by local option and will change from
one county to another.

Hope this helps.

There you go - a useful suggestion: Do on 10 as is done on 20.

"QRZ, is the frequency in use ?"
<2 seconds>
"CQ CQ CQ..."

Seriously, is the regulation about "malicious interference against another amateur station" ? If the other station does not identify itself as another amateur, is it really a station or a source of QRM ?

I don't have a Rulebook, so I don't know what the rules are. Sorry to only add QRM to the discussion, but I like the idea of using RTTY, SSTV, or CW to fight back.

>might well attract serious federal law enforcement attention.

This is a "published" figure by GI that I am having a hard time believeing.
It also includes all unsold and weaehoused units and IRD for people who just
want to receive the few clear stations. Also, a good number of people bought
VC's to watch Fixed access television (The way PBS is now being shown) which
does NOT require authorization. My educated guess is that more like 1.5 million
are "sold" by GI, 250,000+ units sit on dealears shelves waiting to be sold,
250,000 or more have "left the country" (we have no control over this problem),
and maybe 150,000 in homes not authorized for a reason. (reasons could include
they only want fixed access, program costs too high so they boycott, they
bought when the "limited" number scare indicated better buy now and never
authorized, or no longer in operation (like mine!).) This would leave perhaps
250,000 to 350,000 units in "pirate" mode in the U.S. which is not as bad as
GI wants to make it look.
>
> It is also amazing that a million relatively upscale families able to
>pay $1500-2000 for a TVRO system (and to own a site on which to put a dish)
>are perfectly willing to steal cable service that other people pay for. This
>reflects the sort of society in which we live, I guess. (Perhaps it also
>reflects the sort of people who bought TVRO systems in the first place with
>the rights to use the signals so ambiguous.)

This is a very one sided view. There's lots more to this. The cost to the home
dish owner for fees for subscriptions is 2 to 3 times the cost via cable and
sometimes 10 times the cost to the cable system for the same service. As a dish
owner, that person owns and repairs their own equipment, Owns their own land
for the sight, and rents NOTHING from the service. Factoring all this in the
home dish owner pays 10 to 20 times the cost of the service from cable. WHY?
Many reasons. Does monopoly ring a bell. Does price fixing? I myself thought
twice about fixing a VCII but decided the risk was to high. Dish owners just
wanted to be treated fairly and were not. Example: Dish owners offered to
pay for HBO service BEFORE they scrambled. HBO claimed it would be too
expensive to deal with individual dish owners but rejected the idea of a

company being a cableless cable company and doing the billing for HBO and the like. Enter scrambling. HBO now sells and continues to complain about the excessive costs of dealing with indivduals. They authorize distribution companies to sell their service. These companies discount the service sharing their cut with their customers. 8 months later, HBO changes its mind and stops allowing 3rd parties to sell their subscriptions. This increases the cost to the average dish subscriber by 28%!!! In addition, HBO and Cinemax must be bought together. The cost is almost $15 a month. My cable company charges that and that has to include the overhead for their equipment. PRICE FIXING! They let the 3rd parties "trap" customers who do not wish to deal directly with HBO because they are too expensive into buying the "discounted" service and then tell them that they can only renew at the higher rate directly from HBO. I dropped my subscription.

And please DO NOT judge me based on your warped idea of fairness and what kind of person you think I am. I bought my dish to receive not only more variety and selection of programming, but to get a decent picture. I own very good video equipment and quite frankly the picture supplied by local cable was less than even OK. It stunk!! Noisey, bad stereo, many many drop outs, often complete loss of service. Most owners of dish systems buy them because they live in fringe areas where they receive no or few broadcast signals and have no access to cable. (I write for a Satellite magazine and have access to the data. I did not make this stuff up!). If your want to draw conclusions, please get the facts correct first! I'm sure there are people who got a TVRO system because they thought they could get around the cost of cable. Stupid idea because at that before scrambling a TVRO system cost $5000 or more. You could watch a lot of cable for that price. No, most people bought their early systems because it was just another source of signal DXing and a lot of fun to watch backhauls and unavailable sources sources of TV signals. Its still fun!

>
> Does anyone know whether the current FCC/FBI crackdown is motivated
>by the $500 million scale of the cable TV signal piracy problem or reflects a
>broader federal determination to aggressively enforce the view that the right to
>passively and privately receive a radio signal is a privilage granted by the
>transmitting party rather than a natural right having its origin in the laws of
>physics and common sense ?
>
Wow, what a question! I wish I had an answer. One reason the government is involved is that VCII use DES (data encryption standard) and breaking that standard could be stretched to include treason (what a stretch!!).
Even more possible: The satellite and cable comapnies own one of the biggest lobbies in Washington.

What really amazes me is that even if there are 1 million satellite pirates, how many cable pirates are there? Gads, I can buy a cable descrambler in the back of Radio Electronics for just about any cable system in the US. Given a system like Gill Cable in San Jose area, I could then steal almost all the pay service currently on Satellite and at much less cost! (I DO NOT subscribe to Gill cable and obviously don't steal their signal) What is being done about the possible 30+ million cable pirates?

> In any case I guess the quiet hobby of passively listening to the radio
>out of curiousity and for no particular economic gain, except perhaps that gain
>that stems from sharpening one's technical skills, is now largely illegal
>and soon perhaps to become an aggressively prosecuted offense. Back in
>1978-1979 when Bob Cooper and friends started to publicize the possibilities of
>intercepting microwave signals from satellites and exploiting them to obtain
>free cable programming, I thought that I saw the end of this quiet little hobby
>of high tech signal exploration for the technical elite. And alas that day of
>reckoning is here. I've often wondered if by founding a large scale industry
>fuelled by signal piracy they accellerated the inevitable process of locking up
>the spectrum or slowed it down. If they hadn't created the TVRO business would
>the 1989 law still be the old gentleman's section 605 that didn't quite make it
>explicitly illegal to intercept signals in the privacy of one's home if there
>was no obvious economic benefit or disclosure ? Or would scanners and cellular
>phones have done it anyway ?

As I said above, at the time Bob Cooper was talking about "stealing" cable signals from the satellites a system cost $5K or more. A very expensive way to get programming. If you gave this just a second of your thought you would have figured this out. Sounds more like you just want someone to blame for the this possible loss of your right to DX? Blame the source of the cable programming for excessive rates and charges for creating the possibility of a group of pirates in the first place.

Cellular phones were a prime ingredient in the most current law. TVRO was only one part of a growing problem. And by what standard do you decide that its OK for you to listen to "private" communication on your SW radio but not OK for someone to watch an in the clear satellite broadcast of the news? Oh yes, you couldn't do that so it must be wrong!

The real bottom line here is greed. Why else would Showtime/The Movie Channel and other movie services be suing HBO? If HBO and the like had spent the same multi BILLIONS of dollars it took to fight pirates, build and REBUILD the scrambling system towards lower cost programming, the problem would go away all by its self. If the cost of the services was FAR less making the cost of "stealing" the service economically unfeasible to any pirate, the problem would not exist. Since I own my own system I can tell you that to be competitive with a cable system the cost of HBO would need to be $4 or $5 dollars a month MAX. I did subscribe to quite a few services at this cost and ended up spending $30 a month in fees to get near what the cable company offered for $10 a month less. Granted I got a better picture and digital sound, but rolling in the cost of my equipment and repair, my cost was closer to $50 a month. Over time, a $300 "fix" to a VCII starts looking good (takes 10 months to pay for it self). But if the cost of services equated to 2 years of legit programming, most pirates of today would not have converted their systems.

One more note on greed. Why is it that CBS and NBC are scrambling their regular satellite feeds of the regular "free" broadcasts? If I am fortunate enought to live in an area with broadcast TV, I get it free. But if I live in the boonies, now i must subscribe at a cost of $70/year or more to see this "free" TV. What motivation do the broadcasters have? Why cut viewers? While the satellite feeds are lacking LOCAL comercials, the newtork ads are still seen.

Care to comment on this? But wait, it gets better! Now all football and baseball feeds are scrambled. Now you must live in an EXACT area to get these free signal (I am aware of local blackout laws and VCII handles that problem but is unused). And the general public is NOT offered these feeds. There is talk in the industry to offer next years football bowl games, the 1990 world series, the next olympics on PAY PER VIEW only! Great eh? They will be scrambled and offered to dish owners at a higher rate than to cable subscribers!!!!!

And of you think there is not a conspiracy between cable companies and satellite program suppliers, consider this. A number of suppliers originally indicated that they would NEVER scrambled as they were comerical supported and free to most cable viewers. (CBN for example). They scrambled. Why? Because they were told by the large cable companies that if they did not scramble they would be dropped. Now most of these stations get 10 cents a household from your local cable company each month. Imagine the loss of revenue if a large company like Viacom decided to drop one of these channels! When this was investigated none of the suppliers wanted to talk. Why? Think they might have been dropped! You bet!

So please don't blame the TVRO industry for the problem. If you want to blame someone, blame the cable companies. They are much like the phone company was years ago before the split-up. And if you don't believe that, try and get good service from most of today's cable companies! Thats a laugh!

(Stepping off my soap box now. Sorry for the long reply)

1385. Radio Shaft PRO-2005 (mods and power cords)

Newsgroup: rec.ham-radio
Date: 1989-06-24 01:41:34 UTC
From: ghg@pur-ee.UUCP
Message-ID: <12041@pur-ee.UUCP>
Source record: 18157

A radio shaft manager told me that he received a memo
around a month ago, which orders the immediate termination of
any company employee whom discloses any knowledge which lets
the customer snip a diode to restore cellular coverage.

If there is only one employee on duty [whom divulges the info
on which diode to cut], then the employee making the "catch"
is required to confiscate the offender's keys and "take over"
the store. "H & H" (Hopper & Hawkins, the radio shaft
"internal police") also watch for cellular info being passed.

Also mentioned, was the non-removable power cord, and the lack of
mobile mounting brackets were "on purpose", as there were problems
[with the laws?] in several states of selling it.

I am planning on riding my motorcycle back to Chicago next week. So in case of a breakdown, I bought a handheld CB to communicate if something happens.

Unfortunately, it did not come with a manual on how to operate or the protocols involved in communicating with someone else. I would like to test the transmitter but I do not what to say.

I am not a radio buf, but if someone could e-mail me a few tips on what to do it would be appreciated.

Mark

1387. Grundig shortwave portables

Newsgroup: rec.ham-radio
Date: 1989-06-24 04:51:31 UTC
From: witold@enme.UCalgary.CA
Message-ID: <1552@cs-spool.calgary.UUCP>
Source record: 18153

In his article Paul Rodman (rodman@mfci.UUCP) asks for the advice on
portable SW receivers. Me too :-)
I want to point on Grundig Satellite series (400, 500, 650 and others).
Maybe they do not fall into this category as some are heavy, stereo or
equipped with tape recorder.
But I have heard that they are worth considering.
I would like to ask:
- those who knows anything about them to send information to Paul;
- and Paul :-) not to discard it but include in the summary.

Thank you in advance,
Witold

The following is the script from this weeks Amateur Radio Forum. Please feel free to respond to the survey question and/or comment on any of the issues presented. Your contributions will be included in the Action Letter to Congress.

The Amateur Radio Forum is a radio talk show conducted on the Amateur Radio short wave bands:
Thursday 9:PM CTD on 3.950 Mhz, LSB.
Monday 8:PM CTD 147.39 rptr (local only)
.....

JUN 22, 1989 {RADIO SCRIPT... NOT EDITED FOR TYPOS AND SPELLING}

CALLING ALL RADIO AMATEURS ..... THIS IS NR9Q IN CHICAGO

YOU ARE INVITED TO PARTICIPATE IN THE AMATEUR RADIO FORUM. THIS IS A CURRENT EVENTS ROUND TABLE DISCUSSION. EVERYONE IS INVITED TO PARTICIPATE AND YOUR COMMENTS ARE WELCOME. IF YOU WOULD LIKE TO JOIN IN THE DISCUSSION TONIGHT, PLEASE CHECK IN NOW TO N R 9 Q IN CHICAGO.

.....

The decision yesterday, by the Supreme Court, saying one has the right to desecrate the American flag in any manner one chooses, makes it necessary to bring the issue to the Forum again.

The Supreme Court has simply said that the First Ammendment guanantees the freedom to desecrate the flag.

It is pointless to argue about the decision but a number Congressmen and President Bush feel an end run around the Supreme Court is in order. The Congress could enact legislation to make it a crime to desecrate the flag or even ammend the Constitution if necessary.

The other possibility is to cut off federal funds from any organization that uses taxpayers's money to support acts of flag desecration.

Tonight's survey gives you three choices instead of the usual yes or no.

Do you favor.....

Criminalizing flag desecration _____

Cut off Federal funds to desecrators _____

Do nothing at all _____

.....

The state of West Virgina has a law which revokes the drivers license of a minor if he or she drops out of high school. The state supreme court has ruled the law unconstitutional but it sure seems like a good way to keep kids in school.

.....

It was very interesting to hear William Kuntsler (sp?) defending the right of protesters to burn, walk on and generally desecrate the American flag on Crossfire tonight.

However, he admitted that he would not defend the right of an American to even display a Nazzi flag. As a matter of fact, he said that he resigned his seat on the board of the A! C! L! U! because they defended the right of swastica waving protesters in Skokie.

One can't help but wonder how long the exhibit at the Chicago Art Institute would have lasted if it had been an Israeli flag. Wouldn't it be fun to find out?

.....

For an interesing historical note on the dangers of semi-automatic weapons, we take a look at the assination of Leon Trotsky.

His would-be assasin opened up with about 200 rounds from a unknown make of fully automatic machine gun. When this people's hero received news that Trotsky received on a few minor flesh wounds, another assasin was dispatched to finish off the job with an ice axe.

.....

The execution of protesters in China makes what already happened only that much more obscene. I really don't think it is much of our business what other countries do with their own people. But it seems equally obscene to maintain a "most favored nation" status with China and continue business as usual.

It is another good example of our double standard system of morality that makes us no better than those we condemn. Our high moral values reach only as high as our wallet.

.....

Communist countries may be opening up to glasnost but they seem to welcom religions with less than opens arms. A recent shipment of bibles to Romania was reprocessed into toilet paper.

.....

The Supreme Court handed down a decision today that makes lawyer bashers dance with glee. They have ruled that confiscated drug money cannot be used to pay legal fees. The lawyer who brought the suite is out $200,000 in fees for defending a scumbag drug dealer. Justice is sometimes served.

.....

President Bush has launched his thousand points of light but it seems to require a jump start.

He proposed a grand program of volunterism that somehow is going to cost taxpayer's millions. Aparently he has changed the definition of volunteer.
.....

Finally our weekly report on our special ally in the mideast.

Three times this week Israeli's terrorized innocent civilians in Lebanon by bombing refugee camps and claiming pre-emptive strikes against terrorists.

There was a story on the Voice of America (VOA) this afternoon about the plight of Palestinian children who have had their education "interrupted" because of the closing of schools by the Israeli army.

As though keeping children out of school isn't bad enough, the story went on to say that the army has blown up the homes of three teachers who dared to teach children in their homes.

5 Palestinian children were shot to death by Israeli Death Squads this past week bringing the death toll to 506 and the wounded pushing 50,000 since the stone throwing began.
.....

One final question on flag burining.....

Does anyone out there know a singel country, in the history of the world, that allowed its flag to be desicrated? If we are the first, what does it mean?

The Amateur Radio Forum (ARF)

1390. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-06-25 00:39:55 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8906250702.AA21698@ucbvax.Berkeley.EDU>
Source record: 18164

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

1391. Re: Cordless Phones & Privacy -- legal decision

Newsgroup: rec.ham-radio
Date: 1989-06-25 01:25:02 UTC
From: tad@ssc.UUCP
Message-ID: <1953@ssc.UUCP>
Source record: 18165

Actually, I think that the article on cordless phone privacy DID mention ECPA, in a roundabout way. It said that a recent overhaul of federal wiretap laws specifically exempted the radio portion of a cordless phone call from any expectation of privacy.

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* OSCAR-9 NEWS *

The current operating schedule for OSCAR-9 indicates that Diary software reloads will take place on Tuesdays, UTC. Digitalker telemetry will follow. The telemetry channels currently being downlinked by the Digitalker include:

08 : Battery Pack A Temperature (C)
18 : Battery Pack B Temperature (C)
22 : Battery Voltage +14V (Volts)
29 : Spacecraft -Y Facet Temperature (C)
35 : 145 MHz Beacon Output Power (UnCalibrateD)
39 : Spacecraft +Y Facet Temperature (C)
49 : Spacecraft +Z Facet Temperature (C)
59 : Spacecraft -Z Facet Temperature (C)

From Thursday at around 12:00 UTC, the spacecraft will transmit the following sequence of data at 1200 bits/second:

Telemetry : 60 seconds
News Bulletin : 60 seconds
Whole Orbit Data (WOD) : 150 seconds

This will continue until 06:00 UTC on the following Tuesday when the beacon will switch off to help facilitate a software reload.

The current "non-official" KD2BD prediction for the re-entry of OSCAR-9 is mid-September. Since it's in a much higher orbit, OSCAR-11 is expected to remain in orbit for about 26 more years!

* SPACE SHUTTLE NEWS *

The next Space Shuttle mission will be feature shuttle COLUMBIA on mission STS-28. This will be a DoD mission. Columbia's target date for tow to the Vehicle Assembly Building (VAB) is no earlier than June 30. While in the VAB, Columbia will be mated with its external tank and Solid Rocket Boosters.

Finishing touches for this week include paiting the name COLUMBIA on the left
and right forward fuselage under the windows.

* OSCAR-13 SCHEDULE *

Date : 14Jun89 until 16Aug89 | 16Aug89 until 16Nov89
Attitude: 180/0 | 210/0
Mode-B : MA 0 to MA 110 | MA 3 to MA 160
Mode-JL : MA 110 to MA 145 | MA 160 to MA 200
Mode-B : MA 145 to MA 255 | MA 200 to MA 240
OFF : % | MA 240 to MA 3
Mode-S : MA 150 to MA 160 | MA 210 to MA 222

Also, for a trial period the OMNI-directional 70cm antenna will be connected
to the Mode-B RCVR from MA 20 to MA 40. These changes have been introduced to
enable stations who have access around perigee to experiment with perigee
operation. Mode S unchanged. 14May89: BLON/BLAT 212.0/+2.4 with a drift rate
of 0.016/-0.061 deg/day, respectively.

Transponders will be in operation during the whole orbit from June 14 until
Aug 16 due to excellent sunangle and power budget. No perigee operation
between August and November due to perigee solar eclipses!

X-TELECOM-Digest: volume 9, issue 208, message 1 of 3

Indiana Bell service in the northeast section of Hammond, IN has gone to hell, but the telco says its not their fault, and they are trying to work with the people involved to correct the problem.

For instance, consider the case of Steve Gescheidler, a resident of north Hammond, living just a few blocks from the Illinois/Indiana state line: he shares a party line with Jesus. When he picks up his telephone, a voice will often be on the wire reading from Ephesians, or bellowing at him to repent before he Burns In Hell forever. Sometimes the voice is trying to sell him spiritually enlightening audio tapes -- Visa and MasterCard accepted, of course.

His neighbor around the corner, Judy Maruszczak, has a heavenly instrument also: When she tries to make a phone call, it will often times be drowned out by hand-clapping gospel music. Her VCR also likes to preach to her.

The Hammond legal firm of Efron and Efron owns a pious dictaphone machine. When the secretary is in the midst of transcribing legalese, threats of fire and brimstone suddenly are heard on the tape. In addition, their phone system is electronic, and when they put calls on hold, as often as not a few seconds later the hold is broken and the call is lost. Several times per day the phone will ring, and no one is on the line at all.

Linda Reynolds, another resident in the area said her television, her VCR and her cordless phone all began urging her down the righteous path last fall. She said sometimes at night the cordless phone begins ringing by itself, and going off hook for no reason, tying up their wire-line.

Nine year old Tommy Kotul learned how to find salvation while he was trying to play 'Sports Baseball', an Atari game cartridge. He also said that one day in school, a choir started singing hymns over the school's public address system, which is in the form of speakerphones connected to the intercom phone on each teacher's desk.

Although the sanctified interference shows up in the damndedest ways, on all sorts of electronic gizmos, it invariably is on the phone lines of the good (and presumably by now, God-fearing) residents of North Hammond, an Indiana community which straddles the Illinois state line with the communities of Burnham and Calumet City, Illinois to the south and west, and Chicago at it's northwest tip on the state line.

So people began asking Indiana Bell, "what the heck is this, anyway?"...

WYCA-FM Christian Broadcasters, Inc....that's what it is.... this religious station, operating at 92.3 on the dial, licensed in Hammond, IN, with transmitter facilities in Burnham, IL is the culprit. Operating with an antenna height of 500 feet, and 50,000 watts of radiated power, the folks at WYCA-FM Christian Broadcasters, Inc. are literally *saturating* a two mile area around the northern end of the Indiana/Illinois state line, 24 hours per day, seven days per week.

Gescheidler lives about four blocks from WYCA's transmitter. He first began noticing the sanctified interference last fall, and it became louder and louder as the months went on, always on his end. "It seems like when I am in the middle of an important conversation, some preacher always comes on and tells me I'm going to Hell," he said, adding that the phone lines had already gone to hell, and no one seemed to give a damn about it.

After complaining several times to Indiana Bell, Gescheidler and his neighbors complained to the Federal Communications Commission, the Indiana Utilities Regulatory Commission, and finally to the radio station itself. No one, he realized, least of all the radio station, was willing to take any responsibility for the problem.

WYCA isn't breaking any broadcasting rules according to Paul Gomell, an FCC Chicago office technician whose duties include periodic examination of WYCA's equipment. "The home equipment is probably not adequately filtered," he said.

"The problem has nothing to do with Indiana Bell's equipment," said Delores Steur-Wagner, Indiana Bell's community affairs manager for Hammond. "If there are complaints, they should go to the FCC."

Chris Alexander, Dallas-based Vice President-Engineering for WYCA-FM Christian Broadcasters parent corporation said, "The signal is so strong, you expect this kind of interference in devices that are not well-shielded. We try to advise people as best we can, and we have worked closely with Indiana Bell and Illinois Bell to resolve complaints."

In November, 1986, the station raised its antenna to 500 feet from 400 feet, and increased its power from 30,000 to 50,000 watts, Alexander said. "We made these changes only after receiving permission to do so from the Federal Communications Commission." Alexander said that this change in power and antenna height created a so-called 'blanketing area' -- an area of about 1.7 miles in any direction of the transmitter and antenna -- where the signal is so strong and so permeating, it is literally everywhere, in everything.

"Indeed this is the case," said one neighbor five blocks from the site. "I have gone for early morning walks in the open field where the antenna is constructed. In the crisp, early morning air, you can almost feel the signal; smell that ozone; sense the corona."

Alexander said, "We operate completely within the law. We observe all FCC regulations at all times." He noted that one condition for the change in

antenna height and power output being granted by the Commission was that WYCA was ordered to assume responsibility for correcting certain types of radio interference in an area 1.7 miles in any direction of the station for a period of *one year* afterward. Alexander said during that time they worked closely with the telcos involved and "....anyone who complained about interference was given free of charge the filtering devices they needed...some of our people helped install them....just what the FCC said we had to do, we did it, in the geographic area required, for the length of time required...."

Alexander noted one of the first complaints about the increased power came when prosecutors in a federal drug trial in Hammond tried to play wiretap evidence for the jury: instead, the tape recorder offered up hymns and homilies.

Paul Gomell of the FCC noted that they have received complaints about the station relating to answering machines, speed-dialing equipment, cordless phones, cheapie phones, hold buttons, Touch-Tone service, and VCR's. These appurtenances and others -- like the preaching Atari game -- lend to the appearance that God is everywhere, at least in Hammond.

One Indiana Bell service representative spoke, on the condition that she could remain nameless, saying that the telco had handled over 130 WYCA-related problems in the past year, but Bell spokeswoman Steur-Wagner said the company does not keep track of such things and she had no way of confirming this report.

The next step to reduce the interference -- with no guarentees that it will completely end -- is to have all the interior phone wire shielded in steel casings, said Tim Timmons, Indiana Bell's regional maintainence manager for northern Indiana, "...plus of course have good filtering where the phone lines come into the building..."

"What a deal!", said Gescheidler. He recently priced the job at $300 per phone from an independent contractor. "Indiana Bell said *maybe* they could do it a little cheaper for us...but they say it is not their obligation to resolve the problem any further." He mentioned that, "...one day some guy from WYCA came here with a phone man; they had some cheapie looking filter they plugged in...it didn't seem to do any good."

Although the parent corporation of WYCA in Dallas may have good public relations, the neighborhood says local staff at WYCA-FM Christian Broadcasters, Inc. isn't at all concerned any longer. "They have heard so many complaints I guess they quit listening to them any longer," said a neighbor. "When I called one day -- one day when it seemed like they were much louder than usual -- and asked them in a nice way couldn't they modulate their signal a little better, a lady there told me I was being blasphemous. She told me it was anti-religious to complain. She said I should be thankful that I was able to hear the Word of God, and she hoped I would someday realize I would Burn In Hell without accepting Jesus as my Savior. That's the last time I bothered calling *them* to complain. Now the FCC and Indiana Bell say *they* can't do any more either?"

No madame, they cannot. As Chris Alexander, VP-Engineering has explained time and again when asked, the Corporation follows all FCC rules at all times. "We ALWAYS do exactly what the government tells us to do," he said.

And Indiana Bell brings the wire to the drop by your house. They say the line is as clean as it can be at that point. You do the rest.

An old folk-prayer says, "My Lord....nothing is going to happen that You and I can't handle together. Amen." But one can have too much togetherness, as the residents of North Hammond will attest.

Said Steve Gescheidler, "On the radio, they are praying for me. Meanwhile, I am praying for a phone line I can talk on without being disrupted by the choir and the organist."

Radio Station WYCA-FM
Studios and Executive Offices
6336 Calumet Avenue
Hammond, IN 46301
92.3 on FM dial throughout northern Illinois and northern Indiana.

Subj: HAPPY BIRTHDAY DEAR AO-13 & AO-10

HAPPY BIRTHDAY OSCAR-13 and OSCAR-10
==========

AMSAT OSCAR-13, the very successfully international spacecraft to
support science education, amateur space communication and above all
international friendship, is now * 1 Year * in Orbit.

Launched onboard the first ARIANE-4 Mission V22 on the 15th June 1988,
the latest AMSAT communication satellite was born at 13:00 UTC,
when separated from the transportation structure.

AMSAT OSCAR-13 (P3C) is the third unit of the third generation of
the OSCAR satellite series, developed under the AMSAT programme.
The first one, AMSAT P3A, was lost during the launch failure of
ARIANE L02 on May 23, 1980. The second one, AMSAT OSCAR-10 (P3B),
was successfully launched on ARIANE L6 on June 16, 1983.

Although OSCAR-10 suffers from the lost of its onboard computer (IHU)
in January 1987, the satellite continue to fulfill amateur space
communication now in the 6th year after launch.

Thanks to all institutions, organisations and individuals worldwide,
who have contributed to the big success of AMSAT OSCAR-13.

May we hopefully have the same support for future projects,
that a high powered follower, i.e. Phase-3D, will safe the future
of amateur radio over satellites. It's time to think about it!

SILVER SPRING, MD JUNE 17, 1989
TO ALL RADIO AMATEURS BT

US4P To Be Permanently On AO-13 After Joint US-USSR "DX-pedition"

Jim Hartwell (K7UDG) will be leaving soon along with several members of the Western Washington DX Club to join Gene Kestromin (UA4RZ) and the Ziland DX Club for three weeks of HF and AO-13 operations from the Soviet city of Kazan [Long=305 degrees West, Lat=55.75 degrees North, Elevation=80 meters]. This "DX-pedition" team will be using the "special" call of US4P ("United States 4 Papa"). This call was chosen to commemerate Independence Day (4th of July) which will coincidently, be the first day of operations for US4P. Operations for this "joint" US-USSR "DX-pedtion are scheduled to continue until July 21st. In addition to HF operations, AO-13 Mode B operations are also scheduled whenever AO-13 is within view of US4P. The planned Mode B downlink frequency will be 145.940 MHz. K7UDG pointed out the OSCAR operations on this DX event almost didn't happen due of the lack of a 70 cm transceiver. Because of the difficulty of obtaining commercial 70 cm equipment in the Soviet Union let alone the components to build a "homebrew" converter, K7UDG enlisted the aid of ICOM America. Thanks to ICOM America a brand new IC-475A was donated to the Ziland DX Club just in the "nick" of time. After K7UDG and the other members of the Western Washington DX Club return to Seattle, US4P will stay in operation pemanently on AO-13 from Central Asia. To complete their OSCAR station, the Ziland DX Club will be using a "rather" old IBM PC along with a copy of Quiktrak 4.0 to track OSCAR satellites. UA4RZ says that the enthusiasm for OSCAR operations in the Ziland DX Club is so great that they will soon be obtaining a G3RUH PSK Demodulator so that can be ready with the AMSAT MICROSATs/PACSATs which are scheduled to be launched later this year. So look to find US4P to be a familiar DX station to join the many other DX stations already on AO-13.

[NOTE: K7UDG wants to inform all radio amateurs that US4P will be on HF every evening at 03:30 UTC on a frequency of 14.272 MHz. Also, the Western Wash-ington DX Club has designed a "special" T-shirt commemorating this joint US-USSR DX operating event and if you wish to find out how to obtain this T-shirt, contact K7UDG at (206) 334-2116.]

AO-13 EXPERIENCES LUNAR ECLIPSE

HR AMSAT NEWS SERVICE BULLETIN 168.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 17, 1989
TO ALL RADIO AMATEURS BT

Lunar Eclipses "Blot" Out The Sun From AO-13 Often

On June 3, 1989 at 22:00 UTC AMSAT Ground Command Station Controller James Miller (G3RUH) was casually observing AO-13 PSK telemetry when suddenly he noticed something was drastically wrong. He first saw the battery voltage was falling rapidly; then there was not spin rate. Also, the beacon was warbling!\

At this point, with his heart pumping at full speed and sweat pouring down into his face, he noticed that solar panel temperatures were plunging. His mind raced to figure out what was happening to AO-13. Normally the solar panels stay near 8 degrees C but James quickly noted they were at -10 degrees C! Since the satellite spin rate was calculated from data taken from a sun sensor and the spin rate was showing zero, everything indicated that there was a solar eclipse -- but how could that be possible since there were no predicted eclipses until November. But then it dawned on G3RUH that the situation he was seeing was caused perhaps by a LUNAR eclipse. Upon checking the Astronautical Almanac, he found that AO-13 was indeed being blocked by the Moon! After 20 minutes AO-13 came out of the lunar eclipse and the telemetry indicated that everything was back to normal. From further analysis, G3RUH found that lunar eclipses are a rather common occurence. So in keeping with his "detective spirit," G3RUH has produced the following table. AO-13 users should keep this table posted in the ham shack so as to be aware when these lunar eclipses will occur and AVOID operating during these times.

Predicted eclipses, to the end of 1990 are given below. They are of course only as accurate as one can extrapolate AO-13 Keplerian elements this far ahead.

UTC DUR Orbit MA/256 Max Satellite
Date HH:MM min No. Start End Obs % visible from:

1989 Aug 31 [Thu] 07:09 33 929 13 25 9 S Afr, Aus, India
1990 Jan 26 [Fri] 15:00 26 1240 25 34 85 Aus, Pacifica
1990 Feb 25 [Sun] 06:36 25 1302 70 80 8 N Amer, EU, JA, USSR
1990 Mar 26 [Mon] 22:15 33 1364 115 128 11 NE USA, EU, Afr, JA

[PLEASE NOTE: "Max Obs %" means "maximum obscuration" in terms of area of the Sun's disc. 0=no eclipse, 100=total. These calculations use a Sun model accurate to 0.1', Moon to about 1.0', and AO-13 to the accuracy of the published Keplerian elements.

The partal eclipse of 1989 Aug 31 can also be seen from the ground, from the extreme SE Africa, Madagascar and part of Antartica. The eclipse of 1990 Jan 26 is annular, that is, AO-13 will "see" the whole of the Moon's disc surrounded by a halo of sunlight. On the ground, observers in the South of

New Zealand, Antarctica and South America will also witness an annular eclipse.
WARNING: NEVER LOOK DIRECTLY AT THE SUN WITH NAKED EYE OR TELESCOPE.]

MICROSAT PROGRESS REPORT #5

HR AMSAT NEWS SERVICE BULLETIN 168.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 17, 1989
TO ALL RADIO AMATEURS BT

Major "Milestones" Being Met In MICROSAT Construction

The following MICROSAT Progress Report is made possible by information supplied by Jose Machao (LU7JCN) of AMSAT-LU and Jeff Zerr of AMSAT-NA.

1) Jose reports that all transmitter exciter boards have been completed and tested for frequency stability between the temperatures of +5 degrees C to +15 degrees C. He reports that frequency stability is excellent and the efficiency of the "flight" transmitters is about 72%.

2) All of the printed circuit boards (PCB) for each of the MICROSAT flight computers are being readied to be sent to GMI on the east coast for component "stuffing." A major effort in getting the boards ready are ordering all the necessary integrated chips (ICs). As soon as flight computer part "kits" have been completed for each of the PCBs, they will be sent out. It was felt that because the flight computer PCBs are so complicated due to the six layers and the presence of surface mounted components, it was felt that sending out the PCBs to GMI was the best way to have the components mounted properly. Jeff Zerr requests that if there are any IC procurement "experts" who wish to help AMSAT-NA get the necessary components to please contact him at the MICROSAT Lab in Boulder, CO at (301) 530-7233. The part "kits" are about 70% completed.

3) All four baseplates for the MICROSATs have been completed and accepted. These baseplates will "hold" the MICROSATs to the Ariane Smally Auxillary Payload (ASAP) structure during launch.

4) All the lateral solar panels have been completed. The top and bottom solar panels for the each of the MICROSATs will be completed later.

5) The Battery Charge Regulators (BCR) will be arriving this week from Jon Bloom, KE3Z. They were designed and built by KE3Z using the resources of the ARRL. The first set of batteries have been mounted and glued into place in the battery module.

6) The receiver modules are scheduled to start arriving next week. The receivers are being built by Tom Clark (W3IWI).

NEW 17 METER NET PLANNED!

HR AMSAT NEWS SERVICE BULLETIN 168.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 17, 1989
TO ALL RADIO AMATEURS BT

New AMSAT HF Net Being Planned on 17 Meters Starting July 2, 1989

Doug Lougmiller (KO5I) has announced this week that a new 17 Meter AMSAT HF Net will commence operation on Sunday, July 2, 1989 at 23:00 UTC. The frequency for this new 17M Net will be 18.155 MHz. The Net Control Stations will be KO5I and John Shew (N4QQ). KO5I cited the several unsual aspects of this band for introducing this new AMSAT HF Net to this newly opened band for amateur operations. One of the factors which makes this a good band for HF Net operations is the lack of QRM which makes Net operations difficult on 75M and 20M. Another aspect of the 17M band is the unusual band openings which make this band ideal for stations in Europe. So start planning to join KO5I and N4QQ on 18.155 MHz on Sundays at 23:00 UTC. KO5I encourages all OSCAR enthusiast to start building simple "dipoles" and "sloper" antennas, as he did, in order to be ready for this new AMSAT HF Net on July 2nd.

AMSAT-NA BBS Experiences A Hard Disk "Crash"; Temporary Hard Disk Installed

Mike Parisey (WD0GML) System Operator for the AMSAT-NA BBS reported this week to AMSAT-NA officials that a hard disk "crash" occured Thursday night of this week and had temporarily put the AMSAT-NA BBS out of service. At the present time a "temporary" replacement hard disk has been installed which can keep the BBS "limping" along until a 40 Megabyte replacement hard disk can be ordered and installed. In the interim, AMSAT BBS users can still pick up the latest AMSAT News Service (ANS) Bulletins and Keplerian orbital elements. Only a few of the items on the main "menu" have been affected. Please take note of the "sign-on" message to AMSAT-NA BBS for the latest status. A replacement hard disk will be installed as soon as possible.

[PLEASE NOTE: AMSAT-NA Bulletins can be taken off of the Dallas Remote Imaging Group (DRIG) BBS at (214) 394-7438. Jeff Wallach (N5ITU), System Operator for the DRIG wants to inform all AMSAT BBS users that they are welcome to use the DRIG BBS at any time. Jeff says that the ANS Bulletins can be found by selecting "Bulletin #7" from the main menu.]

AMSAT-NA BOD NOMINATIONS OPEN

HR AMSAT NEWS SERVICE BULLETIN 168.07 FROM AMSAT HQ
SILVER SPRING, MD JUNE 17, 1989
TO ALL RADIO AMATEURS BT

AMSAT-NA HQ Announces That Nominations For Board-of-Director Are Now Open

AMSAT-NA Headquarters announces that nominations for the office of Director are now in order. According to the AMSAT-NA Bylaws (see ASR #187), four out of the seven Board-of-Director (BOD) seats will be up for election this year. The seats on the "Board" which are up for election this year are currently filled by the following individuals:

1) Bill Tynan (W3XO)
2) Jan King (W3GEY)
3) Bob McGwier (N4HY)
4) Andy MacAllister (WB5ZIB)

Each Director will serve for a two year term. Any five "current" AMSAT-NA members or a Member Society, can nominate an individual for a seat on the "Board." Nominees will be asked to provide minimal background and bio-graphical data for publication in Amateur Satellite Report (ASR) and for inclusion with the ballot. Please send your "nominating" petitions to:

AMSAT-NA HQ
Suite #600
850 Sligo Avenue
Silver Spring, MD
20910

The DEADLINE for submitting your petitions for your nominee to fill one of these seats on the AMSAT-NA "Board" is July 7, 1989.

SILVER SPRING, MD JUNE 17, 1989
TO ALL RADIO AMATEURS BT

AMSAT Short Bursts
O S C A R - 1 3

Date : 14Jun89 until 16Aug89 ! 16Aug89 until 16Nov89
BLON/BLAT : 178.3/2 ! 210/0
Mode-B : MA 000 to MA 110 ! MA 003 to MA 160
Mode-JL : MA 110 to MA 145 ! MA 160 to MA 200
Mode-B : MA 145 to MA 255 ! MA 200 to MA 240
OFF : % ! MA 240 to MA 003
Mode-S : MA 150 to MA 160 ! MA 210 to MA 222

Transponders will be in operation during the whole orbit from June 14 until August 16 due to excellent sun angles and power budgets. However, no perigee operations will occur between August and November due to perigee solar eclipses! The 70cm and 2M omni directional antennas will be used from MA 230 until MA 30.

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" will be reactivated in July following the mid-June reorientation of AO-13. The

following schedule of Mode "B" ZRO tests with a downlink frequency of 145.840 MHz was chosen for convenient operating times and favorable "squint" angles. AO-13 users who don't wish to participate in the ZRO Test are asked to avoid operating on or near that frequency during these ZRO Test times. Please post the following list of times in your ham shack for the ZRO Tests so that you will have them handy for quick reference:

Saturday July 1, 1989 at 21:10 UTC
Saturday July 8, 1989 at 04:50 UTC
Sunday July 16, 1989 at 07:20 UTC
Saturday July 22, 1989 at 20:50 UTC
Saturday July 29, 1989 at 04:20 UTC
Saturday August 12, 1989 at 20:20 UTC

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. of User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with one unit of postage. The brochure characterizes test procedures, means for obtaining certificates, and gives some historical background about the program. All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception.

Many AO-13 users are unaware that there is an AMSAT Operations Net which is conducted on AO-13 several times each month to help answer questions about OSCAR satellites and to provide information about the many exciting things going on in AMSAT. The following is a list of the times for the Ops Net. Please place this list in a convenient place in your OSCAR station so that you won't miss out on this interesting net which is offered as a service to all AMSAT members.

Here is the Ops Net schedule through June:

Date UTC orb-phs NCS

25 Jun 0300 790-055 (24 Jun local)

Nets can be held on B or JL, but if the AO-13 satellite schedule is changed such that the Ops Net falls during an "off" period, it will be rescheduled. Downlink frequencies are 145.950 MHz and 435.970 MHz for Mode B and JL, respectively. All these are for AO-13 but AO-10 is sometimes used when available.

The following is the operating schedule for FO-12 for the rest of the month of June:

DATE MODE OPERATING PERIOD
06/21/89 JA 01:43 UTC until 18:38 UTC
06/24/89 JA 01:03 UTC until 17:58 UTC
06/29/89 JA 00:35 UTC until 15:29 UTC

de DB2OS 01May89: *** AO-10 TRANSPONDER SCHEDULE ***
01May89 to 13Jul89

Mode-B : from MA 025 to MA 225
OFF : from MA 226 to MA 024

/EX

Subj: BID problem in this week's bulletins

For those of you who post the bulletins onto your local packet BBS, be advised that there is a problem in the Bulletin IDs (BIDs) this week. There are two $ANS-168.07 items and no $ANS-168.06 item. As I posted them here, I made $ANS-168.06 be the first of the two .07's (this is the election bulletin) and left SHORT BURSTS remain as $ANS-168.07.

Suggest you all make this change as you post them -- 73, Tom

Indiana Bell service in the northeast section of Hammond, IN has gone to hell, but the telco says its not their fault, and they are trying to work with the people involved to correct the problem.

For instance, consider the case of Steve Gescheidler, a resident of north Hammond, living just a few blocks from the Illinois/Indiana state line: he shares a party line with Jesus. When he picks up his telephone, a voice will often be on the wire reading from Ephesians, or bellowing at him to repent before he Burns In Hell forever. Sometimes the voice is trying to sell him spiritually enlightening audio tapes -- Visa and MasterCard accepted, of course.

His neighbor around the corner, Judy Maruszczak, has a heavenly instrument also: When she tries to make a phone call, it will often times be drowned out by hand-clapping gospel music. Her VCR also likes to preach to her.

The Hammond legal firm of Efron and Efron owns a pious dictaphone machine. When the secretary is in the midst of transcribing legalese, threats of fire and brimstone suddenly are heard on the tape. In addition, their phone system is electronic, and when they put calls on hold, as often as not a few seconds later the hold is broken and the call is lost. Several times per day the phone will ring, and no one is on the line at all.

Linda Reynolds, another resident in the area said her television, her VCR and her cordless phone all began urging her down the righteous path last fall. She said sometimes at night the cordless phone begins ringing by itself, and going off hook for no reason, tying up their wire-line.

Nine year old Tommy Kotul learned how to find salvation while he was trying to play 'Sports Baseball', an Atari game cartridge. He also said that one day in school, a choir started singing hymns over the school's public address system, which is in the form of speakerphones connected to the intercom phone on each teacher's desk.

Although the sanctified interference shows up in the damndedest ways, on all sorts of electronic gizmos, it invariably is on the phone lines of the good (and presumably by now, God-fearing) residents of North Hammond, an Indiana community which straddles the Illinois state line with the communities of Burnham and Calumet City, Illinois to the south and west, and Chicago at it's northwest tip on the state line.

So people began asking Indiana Bell, "what the heck is this, anyway?"...

WYCA-FM Christian Broadcasters, Inc....that's what it is.... this religious station, operating at 92.3 on the dial, licensed in Hammond, IN, with transmitter facilities in Burnham, IL is the culprit. Operating with an antenna height of 500 feet, and 50,000 watts of radiated power, the folks at WYCA-FM Christian Broadcasters, Inc. are literally *saturating* a two mile area around the northern end of the Indiana/Illinois state line, 24 hours per day, seven days per week.

Gescheidler lives about four blocks from WYCA's transmitter. He first began noticing the sanctified interference last fall, and it became louder and louder as the months went on, always on his end. "It seems like when I am in the middle of an important conversation, some preacher always comes on and tells me I'm going to Hell," he said, adding that the phone lines had already gone to hell, and no one seemed to give a damn about it.

After complaining several times to Indiana Bell, Gescheidler and his neighbors complained to the Federal Communications Commission, the Indiana Utilities Regulatory Commission, and finally to the radio station itself. No one, he realized, least of all the radio station, was willing to take any responsibility for the problem.

WYCA isn't breaking any broadcasting rules according to Paul Gomell, an FCC Chicago office technician whose duties include periodic examination of WYCA's equipment. "The home equipment is probably not adequately filtered," he said.

"The problem has nothing to do with Indiana Bell's equipment," said Delores Steur-Wagner, Indiana Bell's community affairs manager for Hammond. "If there are complaints, they should go to the FCC."

Chris Alexander, Dallas-based Vice President-Engineering for WYCA-FM Christian Broadcasters parent corporation said, "The signal is so strong, you expect this kind of interference in devices that are not well-shielded. We try to advise people as best we can, and we have worked closely with Indiana Bell and Illinois Bell to resolve complaints."

In November, 1986, the station raised its antenna to 500 feet from 400 feet, and increased its power from 30,000 to 50,000 watts, Alexander said. "We made these changes only after receiving permission to do so from the Federal Communications Commission." Alexander said that this change in power and antenna height created a so-called 'blanketing area' -- an area of about 1.7 miles in any direction of the transmitter and antenna -- where the signal is so strong and so permeating, it is literally everywhere, in everything.

"Indeed this is the case," said one neighbor five blocks from the site. "I have gone for early morning walks in the open field where the antenna is constructed. In the crisp, early morning air, you can almost feel the signal; smell that ozone; sense the corona."

Alexander said, "We operate completely within the law. We observe all FCC regulations at all times." He noted that one condition for the change in antenna height and power output being granted by the Commission was that WYCA was ordered to assume responsibility for correcting certain types of radio interference in an area 1.7 miles in any direction of the station for a period of *one year* afterward. Alexander said during that time they worked closely with the telcos involved and "....anyone who complained about interference was given free of charge the filtering devices they needed...some of our people helped install them....just what the FCC said we had to do, we did it, in the geographic area required, for the length of time required...."

Alexander noted one of the first complaints about the increased power came when prosecutors in a federal drug trial in Hammond tried to play wiretap evidence for the jury: instead, the tape recorder offered up hymns and homilies.

Paul Gomell of the FCC noted that they have received complaints about the station relating to answering machines, speed-dialing equipment, cordless phones, cheapie phones, hold buttons, Touch-Tone service, and VCR's. These appurtenances and others -- like the preaching Atari game -- lend to the appearance that God is everywhere, at least in Hammond.

One Indiana Bell service representative spoke, on the condition that she could remain nameless, saying that the telco had handled over 130 WYCA-related problems in the past year, but Bell spokeswoman Steur-Wagner said the company does not keep track of such things and she had no way of confirming this report.

The next step to reduce the interference -- with no guarentees that it will completely end -- is to have all the interior phone wire shielded in steel casings, said Tim Timmons, Indiana Bell's regional maintainence manager for northern Indiana, "...plus of course have good filtering where the phone lines come into the building..."

"What a deal!", said Gescheidler. He recently priced the job at $300 per phone from an independent contractor. "Indiana Bell said *maybe* they could do it a little cheaper for us...but they say it is not their obligation to resolve the problem any further." He mentioned that, "...one day some guy from WYCA came here with a phone man; they had some cheapie looking filter they plugged in...it didn't seem to do any good."

Although the parent corporation of WYCA in Dallas may have good public relations, the neighborhood says local staff at WYCA-FM Christian Broadcasters, Inc. isn't at all concerned any longer. "They have heard so many complaints I guess they quit listening to them any longer," said a neighbor. "When I called one day -- one day when it seemed like they were much louder than usual -- and asked them in a nice way couldn't they modulate their signal

a little better, a lady there told me I was being blasphemous. She told me it was anti-religious to complain. She said I should be thankful that I was able to hear the Word of God, and she hoped I would someday realize I would Burn In Hell without accepting Jesus as my Savior. That's the last time I bothered calling *them* to complain. Now the FCC and Indiana Bell say *they* can't do any more either?"

No madame, they cannot. As Chris Alexander, VP-Engineering has explained time and again when asked, the Corporation follows all FCC rules at all times. "We ALWAYS do exactly what the government tells us to do," he said.

And Indiana Bell brings the wire to the drop by your house. They say the line is as clean as it can be at that point. You do the rest.

An old folk-prayer says, "My Lord....nothing is going to happen that You and I can't handle together. Amen." But one can have too much togetherness, as the residents of North Hammond will attest.

Said Steve Gescheidler, "On the radio, they are praying for me. Meanwhile, I am praying for a phone line I can talk on without being disrupted by the choir and the organist."

Radio Station WYCA-FM
Studios and Executive Offices
6336 Calumet Avenue
Hammond, IN 46301
92.3 on FM dial throughout northern Illinois and northern Indiana.

1397. Re: Another (and tougher) law against listening

Newsgroup: rec.ham-radio
Date: 1989-06-26 16:06:53 UTC
From: sww@optima.optimage.COM
Message-ID: <399@optima.optimage.COM>
Source record: 18169

What is the difference i.E. between listening in on a radio
phone and a discussion between people in public. Both are using
a public medium. I am not in support eaves-dropping on potential
private discussions. What I am disturbed with is the fact that
more and more "freedoms" are being limited by laws. These new
laws against listening aparently make it a already a crime if
one just accidentally listens to such mediums or even has the
means for it.
I am just waiting for the day when they come up with a law that
makes it illegal to listen to conversations in a BUS or in a park.

(get your ears cut off :-)

I am in no way supporting illegal access of transmission services. But
maybe they should use minimal scrambling efforts (for cellulars) to avoid
accidental listening.

It is kind of strange in this country. Here you may buy a gun, the law
says don't use it against people, you don't and may still own such a
deadly device. On the other hand, the law will make you a CRIMINAL
if you are in the possesion of a descrambler but haven't purchased
some services of some big cable or satelite company.

My point is that there are so many laws that immediately may mark you
as a CRIMINAL in this country (even more in other countries) that the
term CRIMINAL seems to have lost its original meaning. Just consider
once you step out of your house you are bound to break some law some-
where.

I just hope I live to see all that "legal mess" cleaned up one day.

1398. MFJ Artificial Ground

Newsgroup: rec.ham-radio
Date: 1989-06-26 17:45:00 UTC
From: Hardie@DOCKMASTER.NCSC.MIL
Message-ID: <890626174527.518261@DOCKMASTER.ARPA>
Source record: 18170

I have used the MFJ Artificial Ground with some success. I mainly wanted it for TVI supression. It did some of that, but not as much as I hoped. The one good effect it had was to reduce the RF in the shack. My keyer would go key down if I touched its case while transmitting on 15 meters. The ground unit connected to a wire going from the 2nd floor to a 4' ground rod eliminated that problem.

I suspect the reason I did not get as much TVI supression as I hoped was that the harmonics were no longer traveling down a much longer wire to the antenna ground (i.e. fairly efficient harmonic antenna), but were now going down the shorter wire to ground (poorer harmonic antenna). However, that ground wire still radiates. I made no attempt to shield it - If I were staying here, I would have tried it.

My unit is currently being tried by N3LN. I do not have a complete report from him. He has only played with it for a few minutes. He had a serious problem on 10 meters. The rig was shutting down from perceived SWR problems. The initial report is the artificial ground when deliberately mis-tuned solves that problem. Can't explain all this yet, don' t have enough data.

I am not convinced that the artificial ground is all MFJ wants it to be. Sometimes it helps.

1400. Re: pulse type QRM

Newsgroup: rec.ham-radio
Date: 1989-06-26 23:21:00 UTC
From: gregm@hpcvra.CV.HP.COM
Message-ID: <5710003@hpcvra.CV.HP.COM>
Source record: 18173

Concerning your broadband signal......

I'll tell you about a recent experience and you can apply it to your
situation as you see fit.

I too had a broadband signal that also affected my TV
reception CH2-6 and was able to relate it to a
signal heard on a portable SW rig. I searched the
house over and finally resorted to switching
the main breaker to verify it was not
originating in my house. I noticed that by walking
up and down the street (parallel to the power lines)
that the signal appeared to be located on my block.
Across the street my neighbor had a small cow pasture
and had his electric fence running. I was able to locate
a signal peak at one of the insulators. I talked to this
person and offered to help him fix this problem. No
problem..... he even provided the new insulator.

Problem solved, right? NOPE. It turned out that this
was not the original problem and I'm not sure to this day
that I would have heard the insulator breaking down.

Anyway, the problem still existed, but it was not over by the
electric fence anymore. It sounded like a BUZZ ..BUZZ.. BUZZ
starting mid morning and ending about 10-11PM.

I called the local power company and they sent out their
RFI guy with a utility van decked out with a scope,
lots of antennas and a spectrum analyzer. He drove up,
I explained the problem and he popped up his directional antenna
and we drove 50 feet down the street to another neighbor.
The power company guy pushed the doorbell and all the buzzing
stopped for about 5 seconds and started back up again.

He explained that there is a thermal switch on the
doorbell transformers that occassionally fail and starts arcing
and can still be related to temperature variations. These transformers
are usually located in the attic which tends to get hot around
mid morning and cool down late evening.

My neighbor was happy to fix the problem by replacing it (he thought I was
causing the problem). It sure is nice to have neighbors
who are willing to work with you.

So anyway, I suggest you might take a radio around with
you and do a survey of the doorbells on the block.

You might even call your power company to ask for assistance. (there was no charge here but suggesting that your power lines might be arcing to something might help you get some help.)

In article <2380@cpoint.UUCP> die@cpoint.UUCP (David I. Emery) writes:
>
> [much about RFI and passing the buck deleted]
>

The radio station is correct. They are not required to do more than they have. It seems that they have done much more than what is required by providing filters free of charge for a time.

It is the telco's responsibility to ensure that RF does not enter a customers house via their lines. This means that they _MUST_ install an effective filter at the entrance of the customers premises. If RF is getting into the customers equipment via non-shielded leads, that is the customers problem.

This problem is easily corrected, one device at a time. I have solved many of these problems. It is even easier because the frequency of the "offending" signal is known. Perhaps the amateurs in the area could make quite a good name for themselves by helping people out with eliminating (or significantly reducing) this interference problem. Although hams have nothing to do with this situation, it seems to me that a more than a few of us have the experience and ability to help people out and score a public relations coup. (Oh, by the way, please do not read anything into the phrase '"offending" signal'. When I desire to listen to such programming, I certainly do not find it offensive.)

Subject: Butternut Butterfly

Sorry about posting this, but (as usual) the mailer is fouled up...

Scott,
On Butternut Beams (you request for info):

I own a HF5B. It's a neat antenna, covers a lot of frequencies in a small space.

As I see it:

Advantages: Compact size, fairly good gain and broadband (except 20).

Disadvantages: Assembly and tuning are *time-consuming*. Assembly instructions must be read carefully and completely, or else you'll end up taking part of it apart and reassembling after attaching the wrong part.

Overall, I'd recommend it, but only if (1) you really need all the bands (i.e., if you're only going to use it on 10, just make a homebrew beam for that band, it'll be cheaper and easier to make), and (2) if you plan to leave it up awhile.

Actually, if I wasn't out here in the middle of the Pacific, I'd offer to sell you mine -- I'm moving *again*, and don't really feel like taking it down and putting it back up.

I disagree. The facilities constructed may be FCC legal, but the
radio station is obstensibly not fufilling the Communications Act of 1934
directive that they serve the "public interest, convenience, and necessity."
The station owner has a continuing obligation to fix the problem, which
may be easily solved.

I have not seen the actual plant involved, but the story sounds
familiar...
The usual causes of extreme blanketing can almost always be traced
back to poor plant design. There are some morons of the opinion that one
gets better FM coverage by installing a low gain antenna and pumping the
maximum power into it. (This may be true at Mount Sutro, CA; but we're
talking fairly flat Indiana/Illinois here...)

Assume that the blanketing contour is 1.7 miles radius (9000 feet)
and that the antenna centre of radiation is at 500 feet. This gives a
minimum depression angle of 3.2 degrees to the outside of the inter-
ference zone. Since the people inside the zone obviously don't need
as much signal, we can conserve power and maintain coverage with a
antenna with vertical gain. An 8-bay antenna is 4 dB down at 3.2
deg, a 12 bay is more like 6-8 dB.

At 6 degrees depression (about 1 mile) these antenns are usually
15 dB down; thus, the 50 kw ERP maximum in the major lobe is reduced to
1.5 kw ERP, which generally bothers no one.

Now, such transmitting antennas are a wee bit expensive, but they
pay for themselves in transmitter input power saved.

But, if you have to repair 100 telephones at an estimated $300
per subscriber; it seems to me to be much cheaper for the phone company
to fix the problem at the source. $30,000 will buy (or damn nearly will;
buy) an excellent transmitting antenna.

We have two class "C" FM's right across the street from this very
terminal; both use 10-bay Collins antennas with circular polarisation;

both are 100 kw ERP and at about 1200 feet. I used to live close enough to one of them to see the **gaps** in the individual radiators from the ground. RFI has never been a problem from these two stations.

I currently live near WPEG Concord, NC; which is 50 kw and 500 feet, with a 6-bay antenna; except in the immediate vicinity of their transmitting antenna, even FM reception is not spoiled, even for stations only 2 mHz removed.

The blanketing case described in the original article is not normal. You have to achieve some awsome field strengths for an FM signal to be this bad of a neighbour. (However, as a teenager, I lived near WFMY-TV in Greensboro; when they still operated from Phillips Avenue. Their 100 kw visual did put a sync buzz in my stereo equipment!!!)

Source record: 18185

About a week ago I posted here asking about possible sources for NEC, the antenna analysis program. I got a tip to write to a gentleman at Lawrence Livermore for more information, but I inadvertantly deleted that letter so I can't pass the address along.

I was clued in to a source of MININEC, the IBM-PC/BASIC version, available via anonymous FTP from wsmr-simtel20.army.mil (26.1.0.74). Get the file: "pd1:<msdos.hamradio>mininec.arc" and also "pd1:<msdos.starter>pk361.exe" if you need a program to unpack the mininec archive. "pk361.exe" will unarchive itself when you execute it, providing the un-archiving routine and some other stuff.

Why don't you look into the World Radio & TV handbook (ISBN
082305920). It has a more or less complete list of time stations around
world.

>
>I'm looking for any experiences people have had with the
>Butternut "Butterfly" (HB..something) antenna. This is
>the HF Beam antenna that looks like a bow-tie.

Butternut HF-5B (for 5 band, includes the 12 & 17 meter WARC bands).

>
>From a physical point of view it is really the only beam
>antenna I could put up in my limited terrain.

I could have put a bigger beam, but I couldn't bear the thought of doing that to my house. I mounted mine on a 20-foot telescoping mast rooted in a tripod on top of a two-story house, for a total height of about 45 feet. There seems to be a noticeable difference between the 10-foot extension of the mast and the full 20-foot extension. This may affect tuning more than performance, but I can't be sure.

>Any experiences?

It is complicated, and much more finicky than a "normal" beam. If you have above-average patience and can follow directions, it should be no trouble. The on-the-ground tuning works pretty well, but is affected by nearby trees etc. so won't be perfect. Expect to work on it some when it's up in the air!

My installation works out pretty well: I can get to the 10-foot level of the mast on a step ladder, and telescope the mast down to that level. Don't even think of putting it up in a spot you can't get to!

I have been pleasantly surprised with the lack of interaction between the tunings of the various bands. Tuning this thing is a bit of a chore, but not anything to worry about.

>How directional is it?

See the specs. (There was a review in 73 about August last year). It seems to me to be quite good front-to-side, front-to-back on 15 and 10 is quite good, on 20 it's OK but not tremendous. (How's that for hard, scientific data?)

>How does it compare with a good dipole or other beams?

It's easier to point than a dipole. On all bands it has more forward gain than a dipole, but not as much as a full-sized beam. I have worked Europe and the South Pacific with 5 watts from my Silicon Valley flatlands location. To paraphrase the reviewer in 73, if you want to crush rocks and barge through pileups, get a kilowatt and a 5-element beam at 100 feet. If you just want to talk on the radio and have some patience, the Butterfly and a typical

transceiver will do you fine.

>How does it hold up as an urban antenna?

It works well electrically and physically. You can use a normal TV rotor and a telescoping mast (with proper guys). It really isn't as small as the propoganda might lead you to think (12' wingspan by 6' boom), but it sure isn't big.

From: cwilliam@umd5.umd.edu
Message-ID: <5062@umd5.umd.edu>
Source record: 18182
Cross-posted to: rec.ham-radio,misc.wanted

I am looking for a hamfest within driving range of the DC metro area (PA or NJ close is ok) as I need to buy some tubes and am looking for an old 20 meg hard drive with a good case and power supply. I will replace the mech in a couple months so the age and quality of the HDmech dont need to be top. I was told a hamfest would be a good place to look. I searched the msgs on here and could not find anything about ham fests in my area so I am forced to ask.

I am not into ham radios and therefore do not normally read this newsgroup and would appreciate replies if you have the tubes I need (1 11DS5 and 4 4CB6 and a manual/schematic for an old tube RCA RVB274 color TV if they have it) a case/cables/supply for sale or know of a ham fest in my area soon that I can pick this stuff at! The TV store said the 4CB6 is a common ham tube that is cheap at ham fests but would cost him $10-15 apiece to order!

Thanks in advance,
- Chris

Any WE Fax people our there? I would like to get into WE Fax but I understand that the software available (ie comes with your TNC) does not do WE Fax justice. In like no gray levels. I assume the TNC provides all the information, its just the software thats deficient?

Where can I get a copy of the specs? I mean it can't be to much trouble to deal with 2 scan lines per sec can it? Besides I've become really accustom to this 19" monitor and Verticom board. I seriously doubt any software supports the Verticom :-)

I remember seeing a video tape that showed a HAM-modeler flying a plane BY the camera. The scene was somewhere out in the desert next to the town that he lived in. He would start the plane, get into his van and then, use the picture on the TV screen and the tracking radar to fly. The most spectacular part was the spin out of the clouds. He was up about 2-3 thousand feet when he broke through the clouds. The landing was quite spectacular too. The screen showed the VAN down below. His approach as seen on the screen looked very similar to that which I have seen in general aviation aircraft. Touch down was flawless. He taxied back over to the van, and that was it. Absolutly AWE inspiring...

The tape was from the RC video magazine series, don't know the date...

In case you strike out at the hamfests, you might try calling
Antique Electronic Supply in Tempe, AZ at 602-894-9503. Their
1989 catalog lists the 4CB6/4DE6 at $3.68 each and the 11DS5 at
$7.31 each. They have a minimum $10 order plus shipping plus a
$2 handling charge.

Oh yeah. I have no affiliation with this outfit.

The likely cause of the problem was pointed out today in comp.dcom.telecom/Telecom Digest, where this discussion began. At least it's the only one that makes sense to me... Here's the explanation in technical terms.

An FM broadcast transmitter runs a Class C final amp. It has a rated efficiency; the FCC allows stations to use the "indirect method" of power measurement by which the power input is multipled by the rated efficiency to calculate antenna power. However, you can in practice get even more efficiency out of it. Trouble is, that invovles tuning it up rather sharply. Since there's lots of bandwidth (150 kHz at 92 MHz) to be covered by the signal, it's possible to tune the final so sharply that it attenuates the outer sidebands. This tends to produce more power output, but of course adds a degree of AM to the signal! In effect, the final amp is slope-tuning itself.

FCC standards require FM broadcasters to keep this AM component 50 dB below 100% modulation. WYCA probably misses this by a non-trivial amount; perhaps it has as much as 20% modulation. This signal, btw, not only causes AM-style blanketing interference, but it also sounds a bit distorted on FM, and has extra FM sidebands making it very wide on the dial. All of this sounds like WYCA.

The source of the story on Telecom Digest is someone who, some years ago, tuned up the WRPI transmitter (Troy, NY) for maximum power one morning, rather than tune to authorized output power. He got more than 2 dB extra out of the transmitter, but RFI complaints came in like crazy that day and he quickly fixed it...

I was in the Soviet Union from 1 June until the 17th, and also had a small SW receiver, a Sony 2002, that I had borrowed. I also have decided never to be without such when traveling in overseas. We certainly got better information from the BBC then we did from local news sources. The 2002 worked just fine, but I want to get something for my own. Can someone give reccomendations or pointers to reviews? The PRO-80 actually looks interesting, since the VHF coverage could be interesting around airports, but how well does it do on SW? Does it have a BFO? Is the SW1S better or worse then the two mentioned above? A side issue is that I think the PRO-80 would look more threatening then a 2002/3, and with the extended VHF coverage might cause hassles. Is Sony the only real choice? Price is not a real consideration, although size and weight are (otherwise, I'd just get a 2010).

Okay, so I'm gonna keep this thing. One shortcoming it has relative to the various Uniden board units is no facility for varying power output. As one planned use is a backpackable solar/battery rig, I need a way to cut out from 20W PEP to more like 5W (no, an output attenuator will *not* do!) What's the best way to accomplish this? I want either a pot or a simple switch on the front panel (or back panel) to cut input power. Voltage limiting? Current limiting the final? Attenuating the drive?
Mike

>at 1-900-410-8463 (1-900-410-TIME). Note that this costs 50 cents for
>the first minute, 35 cents each additional minute. It can be cheaper
>than calling Fort Collins, and is just as accurate.

Why pay for the cost of a 900 call? Those are mostly all ripoffs, at
very exhorbinant prices.

The Naval Observatory Master Clock is also available at 1-202-653-1800.
You are automatically cut off after one minute. The cost is about 12
cents if you call during overnight/weekend hours.

If you prefer it in ASCII format at 1200 baud, then dial 1-202-653-0351.

If you prefer Fort Collins in ASCII format at 1200 baud, dial
1-303-494-4774. At the NBS/Ft.Collins number, type "H" right after it
first answers to get a help message.

>protests was carried on Chinese domestic SW freqs?
>

I did not possess the radio. The guy who owned it tuned it in to the
BBC on the hour and also radio Canada. Never tried for the VOA.

We were too busy listening to students and others, and watching the
propaganda on goverment news broadcasts to go ferreting out chinese
SW....

The BBC is not jammed as it is in english. The VOA is jammed because it has
a chinese language service, this is what makes the VOA much more important
in China.

Initially, the day after the massacre, the students were pissed at the VOA as
it seemed to adopt a conservative stance and relayed reports that "30-40"
killed. (according to the students). We were already hearing numbers of 100+
on the BBC and Radio Canada.

Recently I visited Hawaii's Volcanoes National Park. I had my scanner tuned to 408.575 MHz (thanks, "Monitor America"!) and was able to listen to the traffic of the park's Forest Service Specialists. I got to talking with a few of them and they told me that they had five channels that they used, but that they didn't know specifically what the frequencies where.

Is there a way to calculate the frequencies of the other channels given the frequency of one?

1430. RS2004/2005 Measurements

Newsgroup: rec.ham-radio
Date: 1989-06-30 02:29:56 UTC
From: john@anasaz.UUCP
Message-ID: <292@anasaz.UUCP>
Source record: 18200

I have measured the sensitivity of the Radio Snark Pro-2004 and Pro-2005 scanners. Measurements were done with an accurate (+/- 1db) signal generate and an inaccurate ear listening for a discernible 3Khz deviation tone. The aircraft measurement was on AM. All others on NBFM

Scanner 30 50 120 140 146 150 160 170 420 440 460 900
Pro-2004 .20 .20 .16 .16 .40 .35 .20 .20 .20 .28 .13 .32
Pro-2005 .12 .10 .14 .30 .30 .30 .35 .20 .20 .36 .20 .32
Spec .50 ----------.50

All measurements in uVolts.

As you can see, there a bit of sensitivity decline around 150 Mhz. I don't know if this is intentional - that is one place that strong intermod sources exist. Of course it is also where lots of interesting public service frequencies and the ham 2 meter band live. Overall, the scanners are reasonably sensitive as scanners go.

Now, on to strong signal overload. I did not test innermod, but I did test the scanners for strong signal blocking of weak signals. This is done by putting a coaxial coupling tap at the antenna port, feeding through the tap (at quite a lot of attenuation) from a signal generator to provide the weak signal. Connecting a 50 ohm dummy load to the other port to provide a reference (this simulates an antenna with no signal other than the generator), then connecting the real antenna and measuring the difference. Since blocking was heard, two things were tried to improve it: for one experiment, a radio shack 75 ohm FM band reject filter was put in series; in the other experiment, the attenuator switch on the back of the scanner was turned to the -10db position, and the reject filter was left out. Measurements were performed by measuring squelch break threshold on NBFM only to get an objective measurement. Since the blocking signals that are strongest at my location are -15dBm from FM transmitters, I only tested sensitivity in the High VHF band and VHF air band.

Relative Sensitivity (dB)

Scanner Ant Ant + Filt Ant + Attenuator
Pro-2004 154Mhz -38dB 0 dB -9dB
Pro-2004 127Mhz not measured
Pro-2005 154Mhz -35dB 0 dB -9dB
Pro-2005 127Mhz -35dB -8 dB -13dB

So... if you live anywhere close to an FM station (and I don't mean very close - I live about 15 miles away from a mountain full of them), and you use a good antenna, you should try the following experiment:

Tune in a weak but frequent signal of interest (I use Phoenix FD because they are weak here due to mountains in the way). Observe the signal quality (it should be crummy). Turn on the attenuator. If the signal gets any better, you definitely have this problem. If it gets worse, you may or may not have this problem - only the FM filter will tell you for sure. If you have the problem, you probably want the FM filter. However, the low aircraft band will still be significantly desensed by this - there's not much you can do other than build a better filter.

What is happening here is that the fron end has wide band filters with relatively sharp edges. The microprocessor switches these in for different frequencies. The filter for the VHF air and high VHF lets in a lot of FM signal. (I don't know about below the FM band - haven't tested there). The signal goes to an untuned 3 transistor amplifier before going into the mixer. Apparently that amplifier has a high enough gain to saturate at -15dBm, and maybe even at low signal levels (I haven't tried that) . When it is saturated the amplifier loses its gain (blocking through clipping), resulting in the lack of sensitivity (desense). The -15dBm is a fairly lousy input intercept for an amplifier - 0dBm is probably more typical for a radio front end.

I would be interested in hearing from anyone who tries the above test either with the pro-200[45] series or with other scanners and detects the above problem. I will post (if you don't) whatever I hear about that.

1432. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1989-06-30 05:03:22 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8906300704.AA08241@ucbvax.Berkeley.EDU>
Source record: 18208

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

1433. R Beijing Managers' Phone Numbers

Newsgroup: rec.ham-radio
Date: 1989-06-30 06:38:14 UTC
From: rh@well.UUCP
Message-ID: <12490@well.UUCP>
Source record: 18209

I recently came across a brochure from Radio Beijing that gives the telephone numbers of the upper management. It's a year old but may still be accurate. Some people might want to give them a call to express an opinion about their coverage of recent events in China.

China's country code is 86; the city code for Beijing is 1.

1434. microfische

Newsgroup: rec.ham-radio
Date: 1989-06-30 08:57:05 UTC
From: sazerb@pnet01.cts.com
Message-ID: <4512@crash.cts.com>
Source record: 18206

I am looking for publications that put out their magazines/newsletters/etc on microfische. I know that back issues are available for qst, but I would like to know if there are any current issues put out in that medium.

I know that with the age of computers, much info can be stored on disk/tape and is alot easier to store than bulky ole books, but magnetic media is subject to possible erasure when exposed to magnetic fields/heat etc. This is where I like the idea of microfische.

I once saw a catalog that was put out by bell & howell that had many publications and trade manuals on fische, but that was a few years ago, and a recent call to the local B&H got me nowhere. They had never heard of the catalog that I spoke of. To them, if it wasn't going to mean the sale of some equipment right then and there, I was wasting their time. so...

If you have any info on the whereabouts of a present day catalog, or even just the names of som currently published items, please let me know..

thanks
steve ka4ynd (san diego)

1435. How do you like your IC761/781/785, TS-940S, or Paragon?

Newsgroup: rec.ham-radio
Date: 1989-06-30 15:04:18 UTC
From: parnass@cbnewsc.ATT.COM
Message-ID: <1505@cbnewsc.ATT.COM>
Source record: 18211

I'm interested in hearing from owners of these transceivers:

1) Icom IC-761
2) Icom IC-765
3) Icom IC-781
4) Kenwood TS-940S
5) Ten Tec Paragon

How well does your radio perform, especially on QSK (full break in cw)? What features does it lack that you wish it had? With what features/parameters are you especially pleased? Other insights would be appreciated.

Since other readers are probably interested in your answers, please post responses to this newsgroup.

Thanks.

1438. Street Light QRM

Newsgroup: rec.ham-radio
Date: 1989-07-01 14:45:08 UTC
From: eddjp@althea.UUCP
Message-ID: <200@althea.UUCP>
Source record: 18212

For some time I was plagued by a broad-band buzz intermittently in my SW rcvr. About every 10-15 minutes, the buzz would saturate my rcvr for about 1-2 minutes. This only occurred at night. I searched the house, shut off all of the breakers, to no avail.

One night while looking out my window, I noticed the Orange colored street light (mercury vapor??) which went off, stayed off for 1-2 minutes, and then flickered back on. I watched, and it happened again, and I scurried over to my rcvr, and there was the buzz. Back to the window, the light comes on, the buzz is gone. I called the electric company, and the light was fixed. No more problem. For a while...

I have two of these lights within 100 yards of my antenna, and they seem to both exhibit this mode of operation, on occassion. Does anyone know if this is the standard pre-failure mode of those things? Anyone else run in to this? Might there be *thousands* of these things spewing QRM into the evening sky? They seem to be very popular here in New Jersey.

Dewey Paciaffi

1439. FCC COMMISSION APPOINTMENTS

Newsgroup: rec.ham-radio
Date: 1989-07-01 16:46:00 UTC

This is a group of three messages trhat should be of interest to the info-hams readers. If these persons are confirmed we will have more raids on our spectrum. PLEASE HELP FIGHT POLITICAL PAYOFFS!!!!
Donald R. Lee N5IHE

Message #1

*** URGENT!!! ALL AMATEURS MUST READ!!!! ***

Monday, June 19, 1989---We have received word that Sharree Marshall has been nominated to the Federal Communications Commission.

Sharree Marshall is now an employee of the law firm which represents UPS in that firm's so-far successful attempt to remove 220-222 MHz from the Amateur Service for misuse by the land mobile industry. As such, Ms. Marshall is seen to be very prejudiced in her views for the land mobile service, to the exclusion of all other services which can't 'pay their way', especially the Amateur Service.

If Ms. Marshall is confirmed by Senate, it can be well, assured that Amateur Radio will have a very powerful enemy in its rule-making agency at a time when we least can afford it. Why? Because this is not the last grab to be attempted by the spectrum thieves agacnst. Amateur spectra. As of Friday, June 16, we understand that there are two more Petitions poised to take away Amateur bands, one against 902-928 MHz, the other against 420-450 MHz. And look for some of th low bands to be struck after that!

It is incumbant upon EVERY Amateur, whether he or she is active on 220 or not, to oppose the confirmation of this nomination. WHY that must happen is this:

Should Ms. Marshall receive confirmation in the Senate, it will be a much harder and more costly fight to keep those bands from also being stolen.

Now, HOW can we fight Ms Marshall's nomination? The answer is two-fold.

First, you must write to each of your Senators and demand that the nomination not be confirmed. To do otherwise is to inflict the stigma of a double-standard where the subject of conflict of interest is coecerned. Remember that the Senate very recently rejected former Senator John Tower under very similar circumstances. Do do otherwise with Ms. Marshall can be seen as nothing other than a double standard, or werse, hypocrisy.

Second, the 220 NOTES Newsletter is attempting to organize marches on all Federal Buildings in the country to protest both this nomination and the outcome of Docket 87-14 in cities around the country. We intend to attract the national media and we intend to make THEM bring out the conflict of interest issue as well. If the media can investigate John Tower they can also do it in

this case as well....and they should!

Watch your packet bulletin boards (or have your packeteering friends watch for you) for more information. Things are moving too fast for 220 NOTES to keep up in print. The Marshall nomination must be stopped for the future of Amateur Radio, but time is of the essence. Feel free to call the 220 NOTES phone line (815-485-7388) to either offer to help or to get information on our progress. We need your help, your prayers, and a lot of luck, but together we can win this one.

HELP SAVE HAM RADIO---DEFEAT SHARREE MARSHALL FOR FCC COMMISSIONER!!!!!

--- FD 2.00
* Origin: * Export From: N3AIA @ NrAIA * Packet BBS * Schaumburg, IL. (1:115/777.1)

Message #2

President Bush has nominated two new commissioners to the FCC. They are Andrew Barrett and Sherrie Marshall. Barrett is a member of the Illinois Commerce Commission, and is expected to be in favor of more deregulation. Marshall is a Washington, DC lawyer. She was formerly a lobbyist for the FCC and the White House.

Message #3

WB8ICL is right-on in suggesting that each Amateur write his or her Senator and urge the appointment of Ms. Marshall as Commissioner of the Federal Communications Commission be rejected. I would suggest one slight modification.

The White House has recently sent to the Senate nominations of two individuals as Commissioner, Ms. Marshall is one of the two, and is also preparing to send up the nomination of a new Chairman. Each Amateurs should write and/or call their Senators requesting them to ask the following question of each nominee:

"If confirmed will you, as your first official act, vote to rescind the Commission's action in Docket 87-14 removing three-fifths of the spectrum previously allocated to Amateur Radio Operators in the 220 MHz band and used by them for vi-tal Public Service and experimental services?"

If ANY of the nominees refuses to commit themselves to act in the public interest, by taking this step, the Senate Commerce Committee and the full Senate should reject the nominee as UNFIT TO SERVE.

... Joe AD8I @AD8I

.....

The past week has added three more major oil spills to the environmental havoc caused by the Valdez in Alaska. They were off Rhode Island, in Deleware Bay and in the Houston Ship canal. The oil companies call it the cost of doing business, write it off on their taxes and the environmentalists yell bloody murder.

One of the issues that comes up along with the scum after each oil spill is the opposition to opening up the Alaska National Wildlife Refuge (ANWAR) to oil exploration and production.

The oil mongers say we need the oil to reduce our dependency on foreign imports.

The environmentalists claim that we could save more oil, by increasing the American fleet mileage by one mpg, than could ever be provided by, even the most optomistic predictions, of the oil reserves in ANWAR.

And ARF says, I would rather be dependant on foreign oil now, that there seems to be a glut, than down the road, after we run out. Can you imagine what will happen to the price of foreign oil when we have exhausted our supplies?

And furthermore, just what is the meaning of a National Wildlife Refuge? Refuge from what? Big business is the very reason we need refuges. That's what they are all about.

??????????????????

Tonight's survey question.....

Are you in favor of developing oil and gas production in the Alaska National Wildlife Refuge?????

yes_____ no_____

.....

The S and L bailout is taking some interesting twists. There are three plans afloat, so it takes a little sorting out to see who'se on first. The President has a plan, the Senate has a plan and the House has a plan. The House plan is the most demanding of the industry that perpetrated the fraud. Bush's plan is the most benign and the Senate is in the middle.

The House bill says that solvent giants like Chem Bank of NY, First Interstate Bank of Cal and Sears Roebuck Financial Services must dig into their pockets, not taxpayers' to bail out their insolvent subsidaries. It is hard to believe that the Pres and Senate do not see it that way but that's politics for you.

The Senate version excludes $50 billion of the bailout from the budget by smoke and mirrors so they can keep on spending on other pork.

The House version puts it all on the budget but excludes it from Graham-Rudman deficit targets so they can keep spending on other pork.

The Senate abolishes the FHLBB and establishes the Treasury Department as regulatory agency but puts DANNY WALL, the guy responsible for the mess, in charge. House says no Wall.

The Senate allows S & L's to invest in junk bonds. House says no junk.

The Senate ups the amount that owners must invest in their own instution but allows that investment to be good will (read smoke) instead of cash.

Both bills raise $157 billion over 10 years with at least half coming from taxpayers.

.....

In our continuing effort to keep you abreast of the latest news in the gun grabbers war on crime.....

Howard Metzenbaum has sponsored a bill (S 386) that would impose a 20 year prison sentance on anyone "transporting a firearm with three or more magazines".

Current law provides only a 5 year sentance for the CRIMINAL USE of a firearm.

Clearly, the warriers on crime have finally recongized the ultimate evil represented by transporting firearms. Perhaps, finally, they will re-direct the taxpayer's money that used to be spent prosecuting the criminal use of firearms and use it to END TRANSPORTING FOREVER.

.....

METHANOL CONSPIRACY

I have been reading in several sources that there is a conspiracy by the oil/coal industry, bankers and the media to make damn sure that "alternative auto fuel" is always translated "methanol" and not ETHANOL.

Examples were sited such as deleting the word ethanol from President Bush's speech on the topic and an ethanol fueled car pictured in a newspaper, was described in the caption as methanol fueled etc.

The obvious attempt by the conspirators is to prevent farmers from competing with them by producing ethanol from surplus grain and other farm products.

We should not be naieve enough to think that farmers could or even should supply all our energy needs but in my media monitoring, the conspiracy seems to have some merit.
.....

Finally our weekly report on our special ally in the mideast.

The Israeli Death Squads seem to have kept a low profile this past week so the mideast news is good news.

Eight Palestinians were deported today from the occupied territories. Israeli officials claim they were leaders of the Intifada. This is not only a violation of the Fourth Geneva Convention but is an obvious attempt to make sure that the occupied territories is devoid of leaders if and when elections are every held.

And on the home front.....

In spite of massive Zionist pressure, the Liberty Memorial Library was officially dedicated in a formal ceremony in Grafton Wisconsin. The memorial commemorates the deaths of 34 U.S. Navy men who perished in the deliberate attack by Israel, our "friendly ally".
.....

"Nothing great is lightly won"......Ben Franklin (I think)

In article <8906290702.AA24678@ucbvax.Berkeley.EDU> faunt@CISCO.COM (Doug Faunt N6TQS 415-688-8269) writes:
>I was in the Soviet Union from 1 June until the 17th, and also had a
>small SW receiver, a Sony 2002, that I had borrowed. I also have
.....
>have a BFO? Is the SW1S better or worse then the two mentioned above?
>A side issue is that I think the PRO-80 would look more threatening
>then a 2002/3, and with the extended VHF coverage might cause hassles.
>Is Sony the only real choice? Price is not a real consideration,
>although size and weight are (otherwise, I'd just get a 2010).

I think 2003 is a pretty good choice for traveling. I have been
using it for a couple of years. A few weeks ago when the situation in China
was extremely tense, I brought my Sony ICF 2003 in my bag to school
everyday. We, Chinese students from mainland and Taiwan and sometimes
concerned Americans, would gather around my radio to listen to the news
from B.B.C., Radio Switzerland etc every a couple of hours.
I found that the sensitivity on 2003 is a bit too low with the
whip inside the building. I need to find a window and hang the wire antenna
(included) outside to get satisfactory reception during the day time.
I have tried SW1 and Pro 80 in shop before, Pro 80 is more
sensitive with the whip (I guess that partly due to the longer whip), and
it does have a BFO. SW1 is good but does not have a BFO and does not have
fine tuning. During late afternoon and evenings I can get AFRTS (Armed
Forces Radio & TV Service) on my 2003 in SSB decently, but it is not
possible with SW1. (By the way, I think AFRTS provides one of the best US
news coverage.)
I paid $189.95 for my ICF 2003 from a NY mail order firm, which is
considerably less than SW1 and Pro80. Certainly, 2010 is a much better
Radio. But I have only two complaints: 1. Too big and heavy. 2.Too expansive.
A couple of month ago, I saw an ad in the Monitoring Times which
was selling the ICF 2002 for $149.95. I don't know if they still have any
left.

The engineering model is now almost finished and some flight hardware
is already being produced. As you may know, each spacecraft consists of
a stack of eleven module boxes, with the solar panels mounted on the four
sides, on the top a gravity gradient boom of about 6 metres (fully deployed)
and on the bottom the VHF and UHF antennas. The spacecraft measures about
34.5 by 34.5 by 60 cms and the total weight is about 40 kg.
The Department of Mechanical Engineering at the University is making the
flight module-boxes and attach-fittings for both spacecraft. Most of the
experiments are in their engineering test phase, after which a flight-PCB
can be produced for final integration by the end of August.
Solar cells are being laid-out on the panels, now that we have a reliable
method of sticking kapton on the panels (an insulating layer between the cells
and the aluminium panel). These Gallium-Arsenide cells have an efficiency
of 18 percent and are produced by different manufacturers. By mid August we
expect the panels to be back at the University, tested and ready for
integration.

On UoSAT-D two transmitters are flown, one switchable between 1 and 2 Watts, the other between 5 and 10 watts. The low power transmitter is used for continuous operation, the high power transmitter for short burst transmissions. Over the last few days, the bench models of the transmitters and modulators have undergone extensive testing.
The design of the transmitters is by G3YJO and G7DSY, construction by Mark Allery, G7DSY.

1445. The Winnebiko III sneak preview

Newsgroup: rec.ham-radio
Date: 1989-07-02 07:08:38 UTC
From: wordy@cup.portal.com
Message-ID: <20066@cup.portal.com>
Source record: 18219
Cross-posted to: comp.misc,rec.bicycles,rec.ham-radio

(This is a revised look at the work-in-progress on the Winnebiko III, which is of course taking about three times as long as it should. Current status is life in the fringes of Silicon Valley, up to my elbows in various forms of poison goo as I do the cellulose-core, silicon-matrix, polyester-filled composite wheeled auxiliary storage unit (CCSMPFC WASU), otherwise known as a trailer of hot-glued cardboard with fiberglass over it. Someday soon I'll smell solder instead of styrene again. Anyway, the last version of this is pretty dated... if you're interested in the new compu-bike, read on.... and viva nomadness!!!)

The Winnebiko III: A Sneak Preview
A first look at the new Computing Acrosss America system

by

Steven K. Roberts
revised: June 28, 1989

Copyright 1989, Steven K. Roberts; first published in similar form on the GEnie computer network. All rights reserved (but you may distribute this freely as long as your recipients can).

It's happening again. The road is mission, obsession, and lifestyle of choice. I have rented a house in the fringes of Silicon Valley, built a lab, and begun the long, long process of preparing machines, software, and bodies for the resumption of full-time nomadness.

The reason for all this illusory stability, of course, is the Winnebiko -- that perennial obsession of mine, at once mistress and tyrant... that vaguely bicycle-like extravaganza of surface-mount circuit boards and gleaming antennae. The machine is undergoing surgery so major that I have begun to realize that it's becoming a whole new bike, constructed of treasures imported from afar and mined here in the Valley, all layered together like a silicon spanakopita atop my faithful old recumbent frame.

This document is an attempt to characterize the new system, though it's dangerous to write about things that aren't done yet. Changes to this "spec" between now and late-1989 departure are assured, for every new bifurcated widgetframus that looks even halfway bikeable sets my wetware CAD system afire with system-enhancement fantasies.

* * *

I suppose I should first make a quick comment about the reason for all this. You've probably read the basics in other CAA publications: ticket to adventure, agile computing tool, combination of wide-ranging passions, gizmological door-opener, etc. None of that has changed; only grown more ingrained over the years, part habit, part obsession. There are a few new twists, though...

The next journey will be open-ended, and will take us overseas where rare is access to modular phone jacks, power outlets, and the whole automatic infrastructure of familiar American society. To do this right, I want near-total independence in all domains: computation, communication, electric power, propulsion, life-support, and so on. This escalates the Winnebiko system to a new level.

That, plus the original bottom line: it has to be fun. The battered old machine is obsolete. It's architecturally inflexible and much too hardware-intensive. Changes of function require soldering iron instead of editor. It does too little for its weight. There's no computing horsepower of any real consequence, there's too little solar power, setup of radio systems is a pain, and, well, it's just plain boring by current standards of engineering elegance. And so the celebrated switch-encrusted console system is being retired, consigned to a wood stand under a dust cover in the CAA museum where it might utter, now and again, it's synthesized query: "Are you going to ride me now, Steve?"

But rising like a Phoenix from the ashes of the past is the Winnebiko III...

* * *

I don't want to go into too much detail here, for a complete description will, quite literally, fill a textbook. This is an image painted in coarse, hurried strokes, only hinting at the complexities of what it represents.

First, the basic substrate: packaging. The new systems are distributed throughout the 12-foot bicycle-trailer combo, with most computer and control hardware in a streamlined console up front. This unfolds completely for service, and is designed to be autonomous, shock-isolated, and RF-shielded. Behind the seat, a second major enclosure carrries radio communications gear along with a breakaway radio-linked manpack computer systems, and a third subsystem devoted to satellite communication, HF, and power management lives in the trailer. All regions are linked by a power bus, high-speed data cables, multiplexed audio lines, and miscellaneous control cabling.

A major issue, of course, is power. My current system with 20 watts of solar panels, 12 amp-hours of batteries, and wimpy

plug-in charger could never support all the new equipment. The bicycle will now carry 92 watts of solar panels, a regenerative braking system to turn hard-won potential energy into something more useful than hot brake pads, and switching supplies to take advantage of any external power source from a car cigarette lighter to 220 AC. All this dumps into a charge bus, which is tapped by dedicated controllers attached to three 15 amp-hour batteries -- one in the trailer, one in the communications equipment bay, and one up front in the console (plus a small one in the manpack system).

Managing that is one of the myriad tasks performed by the bicycle control processor (BCP) -- which is now a 68000 running FORTH, linked to an I/O expansion unit serving the whole bike and a network of other computers. There are dedicated microprocessors for text-to-speech synthesis, automatic transmission, satellite and ham station control, packet data communications, instrumentation and diagnostics, MIDI control, local area network management, security and remote operations, regenerative braking system, and so on.

None of this takes care of the applications layer -- that's all to run the bike systems. On top of the whole control environment is another network: two DOS environments (a 286 and a V40) to handle CAD, satellite tracking, mapping, text, database, and software development. One is quite enough in theory, but the 286 board is power hungry... I use the little one when waiting for keystrokes and am uninterested in spending energy on heavy processing horsepower. The two share a 40 megabyte hard disk, a 3.5" floppy, and a streamer tape backup unit. And there may be the innards of a Macintosh laptop as well, to support biketop publishing and other graphics-intensive efforts.

I carry a separate laptop in the manpack, of course, but it's a lightweight machine. When off-bike and needing file support (or wishing to check status of autonomous subsystems), I can sign on via packet datacomm in the UHF business band. The bike responds at a low BBS-like level, accepting a special command to boot the BCP for remote FORTH control of the whole system. If I want to get into the DOS environment, a reserved word boots the 286 and redirects console I/O via the radio link to my backpack system, eliminating the need to carry heavy hardware anywhere except in the bike itself where there is space for shock mounting. The backpack also hosts a 2-meter ham radio, as well as a full-duplex audio link to the bike for cellular phone access, local monitoring, security, dictation, and so on.

Any of the communications features can be accessed from any operating level, whether in RF-linked remote mode, via the handlebar keyboard while pedaling, or through the maintenance keyboard while stopped. Cellular phone modem, fax machine, packet

radio, local network control... all are essentially servers on the network right alongside processors and file devices.

The new console is designed to be as flexible as possible. Most of its real estate is given over to a pair of LCD panels -- one VGA backlit display (640 X 480) and the other a more conventional laptop display. A touchscreen covers the VGA, and any processor can request either... depending on power budget, ambient lighting conditions, and resolution requirements. Typically, the BCP's status and maintenance functions are on the little one, and graphics-intensive DOS applications are mapped to the big one (the Mac display will flip down, exposing both at once). One particularly interesting project is computer generation of wireframe map models, showing from any viewpoint the earth's surface in my immediate vicinity with road vectors overlaid in bold strokes and my own location a blinking arrow. (The databases are on CDROM; my location is derived from a GPS satnav receiver; maps are drawn by the CAD package.) Entries from the contacts database can then appear as icons, which, when touched, expand into text windows. In addition, there will be a helmet-mounted display that presents text or graphics directly to my right eye at a comfortable focal length, with ultrasonic sensors detecting my head angle for mouse and window management. All this allows wider-bandwidth I/O with the neuron-based parallel wetware system under the helmet -- using speech, four display spaces, a thumb mouse, handlebar keyboard, and touchscreen as comm channels.

Other front panel devices include a miniature graphic printer for sponsor referrals and business paperwork, digital instrumentation for speed, cadence, altitude, temperature, time, inclination, elevation, torque, effective frontal area, and raw power measurements, and a minimal assortment of switches and LEDs to provide low-level maintenance access in the event of a major system crash. The important thing here is that everything on the bike, except for basic safety equipment like lights, is under computer control and thus completely hackable.

The architecture that keeps all this from becoming an interface nightmare is the key to the whole machine. I call it a "resource bus," linking as it does all nodes in the system -- power, audio, serial, analog, and digital. The devices on the bus are diverse: a MIDI music synthesizer with handlebar keyboard or voice input, all dedicated micros, radio equipment, cellular phone, stereo, digital answering machine, printer, fax board, modem, nav system, speech synthesizer, audio function modules, and so on. The bus is only a bus in philosophical terms -- up close it's a massive FET crosspoint matrix with each junction controlled by a bit in a write-only memory. The implications are interesting: any interconnection is simply a matter of programming, which at the FORTH level is relatively easy. I'll be able to run phone patches between ham radio and cellular while

mobile, remotely redirect local audio through an RF link to my pack if security is triggered, perform diagnostics, have the bike's speech synthesizer beacon on ham frequencies live updates of its exact location if it's moved without the correct password, turn alpha particle hits into MIDI "boing" events, fax out digitized video images via celphone or radio, receive and display satellite weather maps, and so on... all using the resource bus and some basic software drivers.

Mechanically, the new bike is growing in sophistication as well. I've never been happy with my brakes, so the new machine detects the first displacement of the right-hand brake lever as a command to begin proportionally drawing power from the trailer wheels via custom microprocessor controlled hub motors. A hard squeeze invokes a hydraulic disk brake on the rear wheel, and the other lever is a purely hydraulic link to a front rim brake. The transmission is changing too -- from 54-speed manual to 36- speed automatic. Here, the processor monitors speed, pedal torque, cadence, heart rate, and a keyed-in "wimp factor" that expresses my subjective robustness... changing gears to optimize the impedance match between bio-engine and wheels.

One of my big thrills in this has always been communication, ever since those primitive few thousand miles in 1983-4 with 300-baud acoustic cups and a CB radio. I've been carrying 2-meter and HF QRP ham gear for a while -- now there's an all-band HF transceiver built in for global communication, as well as 2-meter and 70cm multimode rigs and an amateur television station. There are three classes of antennae -- mobile verticals, folding beams, and dipoles... and there are spread spectrum data links between bike and backpack, my bike and Maggie's, and so on. But the best part is the new OSCAR-13 station (modes B and J): I'll be able to stop the bike, assemble a pair of crossed-yagi beams about 10 feet long, and fire up the satellite tracker software (it calculates Keplerian elements, inputs my coordinates from GPS or Loran, and displays a world map showing the bird's location, azimuth/ elevation values, doppler shift, pointing angle, and other parameters). With this satellite, I have a hemisphere of coverage at a time during a dozen or so windows a week from anywhere in the world, with the ability to communicate via full-duplex audio under solar power. The uplink power is 25 watts... and the satellite's orbit takes it out to 22,000 miles at the apogee (2.8 earth diameters).

Let's see... what else? Oh -- what to do with extra solar power from the 92 total watts available in full sun (7.6 amps of 12 volts)? Simple -- the software can either throw it into the wheels for a .1 horsepower boost, or use it to cool Peltier-effect solid-state cooling devices installed in my helmet and buried in an insulated space behind the seat. This should have some soothing effects, including cold beer in a hot desert (one of the

world's great pleasures).

There are various standalone additions -- a miniature PC-linked digital oscilloscope with outboard spectrum analyzer, a butane soldering iron, and countless improvements to the camping and touring gear. But you get the idea... this system is an all-out effort aimed at creating a self-maintaining mobile autonomous information platform, constantly in communication with a worldwide network while freely wandering the earth's surface under human and solar power, supporting a freelance writing business and providing unlimited fun to the rider and companions.

Now that's the kind of design spec I like.

* * *

Oh. I did mention the word "companions," didn't I? Two things are happening that involve other people.

First, I've been putting the word out for a while that we're looking for a few exceptional people to take up this life of nomadness with us. The responses are trickling in... there seems to be a hunger for adventure afoot in the land. If you're interested in knowing more, let me know.

Second, the dozens of human intellects and over 100 energetic companies that are cooperating on this new machine represent a truly dazzling resource of creative ability. For almost six years, I've been collecting wizards... and with some of the very best I am now forming an ad-hocracy with two linked goals: market Winnebiko spinoffs and take on selected consulting projects. If this one sounds interesting, give Nomadic Research Labs a call at 408-263-0660. We need help on some of the new bike systems, and I get a lot of requests for consulting time... there's plenty of work to share.

That's enough for now. As the months wear on and the weather turns seductive here at the base of the Diablo Range... as summer days tease me with thoughts of whistling descents and slowly changing vistas... as the legs tense in rhythmic urgency here in my static space... I'll grow ever more desparate for the road. It's out there, an infinite thing of wonder and possibilities, unhurried, patient, waiting. I pound away on eccentric machinery, implementing dreams, thinking all the while of that cold beer in the desert. Soon the adventure will toggle once again from intellectual to visceral and the real stories shall resume.

In the meantime... cheers from the lab!

SpaceNews

MONDAY JULY 3, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* UoSAT D and E *

The MicroSat engineering model is now almost finished and some flight hardware is already being produced. As you may know, each spacecraft consists of a stack of eleven module boxes, with the solar panels mounted on the four sides, on the top a gravity gradient boom of about 6 meters (fully deployed) and on the bottom the VHF and UHF antennas. The spacecraft measures about 34.5 by 34.5 by 60 cms and the total weight is about 40 kg.

The Department of Mechanical Engineering at the University of Surrey is making the flight module-boxes and attach-fittings for both spacecraft. Most of the experiments are in their engineering test phase, after which a flight-PCB can be produced for final integration by the end of August.

Solar cells are being laid-out on the panels, now that a reliable method of sticking kapton on the panels (an insulating layer between the cells and the aluminium panel) has been found. These Gallium-Arsenide cells have an efficency of 18 percent and are produced by different manufacturers. By mid August,the panels are expected to be back at the University, tested and ready for integration.

On UoSAT-D, two transmitters will be flown, one switchable between 1 and 2 watts, the other between 5 and 10 watts. The low power transmitter will be used for continuous operation, the high power transmitter for short burst transmissions. Over the last few days, the bench models of the transmitters and modulators have undergone extensive testing. The design of the transmitters is by G3YJO and G7DSY, with construction by Mark Allergy, G7DSY.

* OSCAR-9 NEWS *

The current operating schedule for OSCAR-9 indicates that Diary software reloads will take place on Tuesdays, UTC. Digitalker telemetry will follow. The telemetry channels currently being downlinked by the Digitalker include:

08 : Battery Pack A Temperature (C)
18 : Battery Pack B Temperature (C)

22 : Battery Voltage +14V (Volts)
29 : Spacecraft -Y Facet Temperature (C)
35 : 145 MHz Beacon Output Power (UnCalibrateD)
39 : Spacecraft +Y Facet Temperature (C)
49 : Spacecraft +Z Facet Temperature (C)
59 : Spacecraft -Z Facet Temperature (C)

From Thursday at around 12:00 UTC, the spacecraft will transmit the following sequence of data at 1200 bits/second:

Telemetry : 60 seconds
News Bulletin : 60 seconds
Whole Orbit Data (WOD) : 150 seconds

This will continue until 06:00 UTC on the following Tuesday when the beacon will switch off to help facilitate a software reload.

The current "non-official" KD2BD prediction for the re-entry of OSCAR-9 is mid-September. Since it's in a much higher orbit, OSCAR-11 is expected to remain in orbit for about 26 more years!

* OSCAR-10 SCHEDULE *

Until 13 July

Mode-B: MA 25-225
OFF : MA 226- 24

14 July-Sept

Mode-B: MA 0-255

* OSCAR-11 NEWS *

Further tests of the new "packet" Whole Orbit Data (WOD) downlinks continue. Here is a recent status information bulletin on OSCAR-11's main computer system:

** UOSAT 2 COMPUTER STATUS INFORMATION **

FAD1 OPERATING SYSTEM V2.0
TODAY'S DATE IS 2/7/89
UNIVERSAL TIME IS 02:13:20 DAY 1
AUTO MODE IS SELECTED
SPIN PERIOD IS - 242
Z MAG FIRINGS = 0
+ SPIN FIRINGS = 72
- SPIN FIRINGS = 0
RAM WASH POINTER AT A01C
WOD COMMENCED 2/7/89 AT 00:00:10
WITH CHANNELS 2 ,61
LAST CMD RECEIVED WAS 72 TO 1 WITH DATA 0

ATTITUDE CONTROL INITIATED MODE 1
DATA COLLECTION IN PROGRESS
DIGITALKER ACTIVE

Note that FAD stands for Forth Applied Diary, which is the operating system for the spacecraft's primary computer. The software was written in Forth, (a high-level programming language). OSCAR-11 is the only amateur satellite running under an operating system written in a "high-level" language. Other satellites operate in IPS or assembler. The switch to Forth makes complicated attitude algorthims (involving trigonometric functions) easier to write.

Over the past week, the 145.825 MHz VHF beacon has been turning off for 10 seconds following the transmission of the DCE message titles.

* OSCAR-12 SCHEDULE *

Date Mode Operating Period

13 Jul JA 1100 - 1912
15 Jul JA 1113 - 1925
19 Jul JD 0939 - 1751
22 Jul JD 1508 - 0804 (23 Jul)

* OSCAR-13 SCHEDULE *

Date : 14Jun89 until 16Aug89 | 16Aug89 until 16Nov89
Attitude: 180/0 | 210/0
Mode-B : MA 000 to MA 110 | MA 003 to MA 160
Mode-JL : MA 110 to MA 145 | MA 160 to MA 200
Mode-B : MA 145 to MA 255 | MA 200 to MA 240
OFF : % | MA 240 to MA 003
Mode-S : MA 150 to MA 160 | MA 210 to MA 222

Also, for a trial period the OMNI-directional 70cm antenna will be connected to the Mode-B RCVR from MA 20 to MA 40. These changes have been introduced to enable stations who have access around perigee to experiment with perigee operation. Mode S unchanged. 14May89: BLON/BLAT 212.0/+2.4 with a drift rate of 0.016/-0.061 deg/day, respectively.

Transponders will be in operation during the whole orbit from June 14 until Aug 16 due to excellent sunangle and power budget. No perigee operation between August and November due to perigee solar eclipses!

TO: Remote Addressee (_INFO-HAMS@WSMR-SIMTEL20.ARMY.MIL)

Subject: W5YI 1 Jul 89: New Kenwood BBS!

For all you Kenwood fans out there:

The 1 Jul 89 issue of the W5YI Report has an item about a new Bulletin Board system operated by Kenwood Communications. I just logged into it; it looks like it's set up mainly for new product announcements and Kenwood customer support for not only the ham equipment line, but the other product lines as well. If you're interested, give it a call at 213-761-8284, 300/1200/2400 (although I could only get 300 to work, but that may be due to 2700 miles of phone line), 8 bits, 1 stop bit, no parity.

1448. High field strengths from broadcast transmitters.

Newsgroup: rec.ham-radio
Date: 1989-07-03 10:39:35 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <03.Jul.89.11
Source record: 18222

When i was at college, i lived in an old farmhouse about 200 yards f om
a multi-channel FM station (3 channels, each 250Kw, and a local 10Kw relay).
I could light a torchbulb if connected across the
inner ends of a halfwave dipole. Several of these 'dipole lights' were
quite successful in providing a 24-hour no-cost way of lighting the entry
to the house. The phenomenal signal strength of the signal made
it difficult to listen to anything other than the local station though.
I have also lit bulbs from TV broadcast transmitters at some distance - there
are a number running approximately a megawatt here in the UK, and a
88-element beam pointed at one of these at a few hundred yards
fed into a 2.5 volt torchbulb was quite bright.
You could get allsorts of odd wave pattern interference effects by
placing metal screens off to the sides of the antenna and moving them
around the place.
I am told that an airtraffic radar set installed on the roof of a car park
at London Heathrow airport caused all the fluorescent tubes in the carpark
to glow in synchronisation with the rotation of the radar scanner. The
local field strengths must be phenomenal!

1449. Novice Ham Test Stack for MacIntosh Hypercard

Newsgroup: rec.ham-radio
Date: 1989-07-03 15:45:58 UTC
From: dls@genrad.com
Message-ID: <23021@genrad.UUCP>
Source record: 18223

Hello again, I previously posted that I have created a Novice Ham Test to use on a MacIntosh with Hypercard. Well, I got one person who complained that it didn't work on his system. After looking into it, I found out that he was using Hypercard 1.1 or before, and I had written the Stack with Hypercard 1.2. Anyway, I fixed the Stack so it works with Hypercard 1.1 by removing a couple of 1.2 specific commands and installing a kludge to get around a 1.1 bug. Also, I found that by compressing the stack, it reduced it from 640K to 250K (oh, well, so I learned something new!).

Anyway, anyone who desires the Stack should send a self addressed stamped envelope and a double sided diskette to:

1450. Tenafly, NJ frequencies found

Newsgroup: rec.ham-radio
Date: 1989-07-04 16:48:04 UTC
From: msmith@TOPAZ.RUTGERS.EDU
Message-ID: <8907041648.AA00365@topaz.rutgers.edu>
Source record: 18224

I called a friend and got the new frequencies. Lots of people in town need
to buy new crystals!

The new setup is: 156.210 MHz - Police
45.120 MHz - Fire, Ambulance, local ALS, DPW, etc...

The above are for Tenafly. Cresskill has changed as well - 155.010 MHz.

In addition, Tenafly has retained their license under a new call to broadcast
on 45.58 MHz - a common local police frequency. In practice, they use this
only when dealing with other towns and in case of major emergency - blackout
with no generator or really bad weather when the phones are out.

From article <1534@unccvax.UUCP>, by dya@unccvax.UUCP (York David Anthony @ WKTD, Wilmington, NC):

[excellent analysis of antenna theory applied to broadcast]

The article mentioned that the FM station's signal was being demodulated by appliances and other devices in the near field.

By what mechanism? I read until the end of the article before I caught the 'FM' tag on the station's callsign? I had assumed that it was AM while reading.

Could it be that their transmitter is AMing enough that the signal is detectable by a nearby diode junction?

RTTY DX NOTES FOR THE WEEK ENDING JUNE 30TH, 1989
BID: RTDX3006

LOOKING AT THE PROPAGATION REPORTS FOR THE PAST WEEK, ONE CAN SEE WHY THERE
HAS NOT BEEN MUCH DX AROUND. BUT AT LEAST IT HAS GIVEN ONE A CHANCE TO
CATCH UP WITH SOME OLD FRIENDS, AND TO DO A FEW CHECKS ON THE EQUIPMENT.
NEXT WEEK MAY BE BETTER, WE HOPE.

OUR THANKS THIS WEEK GO TO G4TYI, G3XTL, OD5NG, W1DA, OZ3TQ, VU2SJV AND
VK2EG.

1454. TAPR and AMSAT support full 2m codeless privileges

Newsgroup: rec.ham-radio
Date: 1989-07-05 16:28:46 UTC
From: karn@ka9q.bellcore.com
Message-ID: <17156@bellcore.bellcore.com>
Source record: 18028

TAPR and AMSAT Support Full Two Meter Privileges For Codeless License

The Radio Amateur Satellite Corporation (AMSAT) and Tucson Amateur Packet Radio (TAPR) support the proposal of the ARRL Committee to Examine a Possible Codefree License in the Amateur Service.

Furthermore, the Boards of both organizations have recently voted to recommend that full two meter privileges be added to those proposed for the new (codeless) Technician. TAPR and AMSAT feel this is important for the following reasons:

1. Codeless licensees should not be placed in isolated "ghettos". They should be able to interact with the existing VHF amateur population and benefit from its experience. We do not believe that usage levels on two meters are too high to preclude this, particularly in the less densely populated areas of the country.

2. Codeless licensees should also have a full opportunity to participate in local public service. As the most popular VHF band, two meters is widely used for these activities; indeed, in many rural areas it is the only practical option.

3. AMSAT's MICROSAT satellites will have uplinks on the two meter band, and AMSAT wishes to make these and other "Mode-J" satellites available to codeless licensees.

4. There is no logical basis for denying codeless licensees full access to two meters, because code proficiency is no more relevant to voice operation there than it is elsewhere above 30 MHz. With the extended syllabus for element 3(A), codeless licensees will have passed a written test in theory, regulations and operating practices at least as demanding as that taken by present Technicians. Fairness dictates that they receive equal VHF/UHF privileges.

5. Two meter privileges will not take away from the goal of a codeless license to encourage use of our less heavily used bands. For example, European and Japanese codeless licensees have access to two meters, but Europe and Japan still lead the US in the development of the 23cm and higher bands. Even amateurs who specialize in packet radio or UHF and microwave development often use two meter FM to coordinate their experiments. We believe that all amateurs, whether or not they have passed a code test, share equal responsibility for developing our increasingly precious and vulnerable higher bands.

6. Codeless licensees will still have an incentive to learn the code and upgrade because they will gain access to the HF Novice CW bands. We consider this a more logical coupling of requirements to privileges

than making code proficiency a requirement for two meter voice operation.

AMSAT and TAPR also support the ARRL Study Committee's recommendation to grant six meter privileges to codeless licensees. We agree that TVI concerns are not sufficent to deny six meter access, as we know of no mechanism by which an operator's code proficiency can affect the TVI caused by a voice or packet transmitter. Furthermore, six meter usage levels are low enough to have made it a target for attack by other services, and one of the purposes of the codeless license is to help protect our bands.

In conclusion, TAPR and AMSAT applaud the ARRL Study Committee for its leadership in a matter crucial to the future of amateur radio. We urge the ARRL Board of Directors to not only adopt the Committee's recommendations, but also to extend the privileges that would be granted to include full access to the two meter band. To this end we also urge every amateur to express his or her support for the Committee's proposal and this extension to his or her ARRL Division Director before the ARRL Board meeting scheduled for July 21-22, 1989.

Doug Loughmiller, KO5I Andrew Freeborn, N0CCZ

1455. Ham radio has its UPS and downs.

Newsgroup: rec.ham-radio
Date: 1989-07-05 17:20:27 UTC
From: AXVSCCN@UICVMC.BITNET
Message-ID: <8907060807.AA29736@ucbvax.Berkeley.EDU>
Source record: 18029

I will condense my thoughts here to keep this message short and so that it can be typed during my lunch hour. About two months ago at a meeting of our local radio club a new member asked why some of our club members were reading off weather information during SKYWARN nets when, in his opinion, reading any kind of weather information was illegal. I explained to him that so long as we were not directly reboradcasting another radio service (ie. NOAA weather radio) and as long as the traffic was directed to the net members that we were legal. A few weeks later, another ham got on the air during a tornado watch and advised me that I was "in clear violation of FCC rules" by running a weather net and that I should cease operations immediately. I advised him that to the best of my knowledge I was operating legally and that he could always file a complaint. Just for a little background information, we have been running a SKYWARN net on this same repeater for every tornado/severe thunderstorm watch for the last 10 years. The major complaint these guys voiced was that I, and the other net control operators, were "broadcasting" since the content of our transmissions was weather and that the general public has been known to monitor our nets.
I knew we were operating legally since the weather bulletins were being directed at the net check-ins as part of the SKYWARN net and not at the general public. Further, there's nothing sacred or taboo about weather. I decided to arm myself with some facts for the next meeting. I called the ARRL Rules and Regulations department and was told that they didn't see anything wrong with what we were doing. Next I called the FCC Private Radio Branch and talked to the Assistant Chief. He too said that we were not broadcasting and that he didn't think we were in violation. He suggested that I seek an official FCC interpretation --I wrote a letter that day.

At the next club meeting, the guy who brought up the original question at the last meeting came prepared with a ten-page document that basically stated we were operating illegally because we were boradcasting and included page after page of FCC rule citations and old ARRL/QST quotes. It was clear to the majority of members at the meeting that this guy's entire arguement was based on the premise that we were boradcasting and that since broadcasting is illegal we were in violation. I and several other club members informed this guy that --yes broadcasting *is* indeed illegal but we were not broadcasting. He then went on an ranted about how he didn't join our club to become a member of our local emergency services and about how his kids (he's a school teacher) were suffering from some form of mental anxiety because he told them weather broadcasts are illegal and yet here we were reading off weather information. He said he would file an official complaint with the FCC unless we ceased all weather operations. He also had a few pages in the paper he distributed that said the nets should have no contact or affiliation with our local emergency

services agencies and that I should have nothing to do with running the nets. Futher information, I'm EC for Jackson County, Illinois and Training Officer for the City or Carbondale's Emergency Services.

After the meeting was over, several of us members got together to discuss what happened. It was obvious to us that the weather net was not the key issue. Rather, this guy was personally pissed at me for informing him on the air a few months ago that using the autopatch to order food from MacDonalds was illegal. Despite the fact that this was a personal conflict not truely related to the weather net, this guy *was* prepared to file an official complaint.

I called back the ARRL and they told me that as far as the new Part 97 rules go (that is, as the ARRL chooses to interpret them) we are perfectly legal. The ARRL sent me a copy of the new rules. After receiving and reading the rules I was still convinced that we were not in violation of any rules pertaining to broadcasting. I did feel uneasy about the section pertaining to carrying on communications on behalf of another person or agency. Taken one way, the rules could be interpreted to read that running a SKYWARN net and passing the information on to a local emergency services agency or to the National Weather Service would be illegal since it would be carrying out their regular business. I decided to call the FCC again. This time I talked to John Johnston, Chief of the Private Radio Branch.

Mr. Johnston basically told me that amateur radio spectrum space is for hobbyism and experimentation. He then went on to say that he has received a number of letters and phone calls about the legality of SKYWARN nets. He told me that in his opinion "...if the NWS needs these frequencies so bad [to gather weather data] it sounds like they need to have them [the frequencies] reallocated for their use. I explained that we were a group of amateur radio operators providing assistance --not carrying out their regular business. He repeated his statement and added that this type of traffic [SKYWARN] would best be carried out on frequencies which are already allocated for emergency services work (ie. Public Safety or NWS).

It's clear to me, and sevaral others in amateur radio emergency services that the FCC is looking for ways to minimize the "emergency communications" component of amateur radio in order to eliminate any justifications we hams might use to maintain our spectrum space. Johnston says that pre-emergency communications (such as weather watches) where there is no "immediate" threat of loss of life or property do not constitute "emergency communications". Combine this with his statements about reallocating frequencies and that emergency services-related traffic, in general, should be carried out on non-ham frequencies and the new FCC appointments and what I see is a conspiracy by the FCC to eliminate ham radio (at least the VHF portion).

I need some help/opinions on these questions:

1) Is running a weather net (where the public receives the greatest benefit) out of a NWS or governmental emergency services office in violation of FCC rules pertaining to carrying out communications on

behalf of non-amateurs or other agencies?

2) Do we need to wait until a tornado actually strikes to activate our SKYWARN weather net if our net is designed to serve the public via the NWS and local emergency services?

3) Should amateurs wait until a disaster strikes and all normal radio/ telephone communications are disrupted or overloaded before they announce their presence and capabilities to local disaster officials or should they work with these agencies well in advance of a disaster?

4) Could weather nets be considered a form of "communications training" to improve operator efficiency and net protocol understanding?

I would be very interested in hearing from the group either directly or via INFOHAMS. I may be reading this all wrong, but I've got a very bad feeling about this. Chris Novy - WA9V

****************

Once upon a midnight dreary
While I pondered weak and weary
Over a pile of QSLs
piled from the bedroom floor
There came a sudden burst of static
From the station in my attic
Then a callsign strange and distant
Then a silence -- nothing more

Ran I to the attic station
Tuned the band in wild frustration
For that callsign unfamiliar
For that callsign heard before
Up and down the band I listened
Sweat upon my brow it glistened
Hoping for another murmur
Like the one I'd heard before

Then another burst of static
Then a CQ most emphatic
But the call was still a wierd one
Never heard my me before
Then I grabbed a call book near me.
Lest the strange one heard so clearly
Might elude my handy log book
Always set for one more score

But no call like that was listed
Through the pages still I twisted
Frantic searched I for the strange one
Now I heard it with a roar
Then the moment of decision
Then a blurring of my vision
As I loosed the power forward
For an answer did implore
```

Then a silence, strange and haunting
Then another try undaunting
Oh to nab that strange new callsign
Excitment shook me to the core
Suddenly I heard a whisper
Stronger now a noise eclipser
Calling me with steady patience
Nearly fell I to the floor

Come in please the signal begged me
Answer please, please can you hear me?
Came the signal, came the signal
Stronger than it was before
Yes, I hear you, Yes I answered
But the call is not familiar
What is your exact location?
Now the beads of sweat did pour.

Tuning now my ears were straining
Perspiration from me raining
Hoping just for one more answer
From that station heard before
Then the answer not expected
From that call to me directed
Then a silence, eerie silence
Only that and nothing more

And I sat in silent wonder
No more did I need to ponder
Whence the callsign strange and eerie
Had been aimed at my own door
Turned the knob and closed the station
Filled with some extreme elation
Turned and left the attic slowly
Locking fast the wooden door.

Turned my back upon the attic
Knowing that the station static
Never would again attract me
Back beyond that wooden door
No more signals to attract me
No more strange ones to distract me
I had heard the strange of strange ones
After that one -- nothing more.

1457. New source of RFI?

Newsgroup: rec.ham-radio
Date: 1989-07-06 01:22:50 UTC
From: rfc@briar.philips.com
Message-ID: <58282@philabs.Philips.Com>
Source record: 18031

A possible new source of RFI may be introduced to the world. Switching power supply technology is being used in "electronic" florescent light ballasts. These are not just the screw-in light bulb substitutes you've seen at your local hardware store, but are ballasts that are mounted inside regular florescent light fixtures. These ballasts operate at about 30khz, and are full of harmonics. Don't know how far these harmonics go up in frequency, but they could reach 80 meters or further. Old fashioned florescent lights would sometimes RFI radio reception, and they operate on 60hz! (It's the sudden spike of current, from the bulb's requiring a miminum voltage to conduct, that does it.) Hopefully, the FCC will put limits on RFI from these devices.
(right :-( )

1458. FCC Appointments

Newsgroup: rec.ham-radio
Date: 1989-07-06 02:16:27 UTC
From: tad@ssc.UUCP
Message-ID: <1962@ssc.UUCP>
Source record: 18032
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Please distribute the following bulletin via packet. I am new to posting on the net, so please remove any extra CR/LF if this comes out double-spaced. Be sure to preserve the BID$.

SB ALL @ ALLUSA $KT7HFC01

Sharree Marshall's FCC Appointment

7/5/89

Sharree Marshall's FCC Appointment

Bulletin ID: KT7HFC01

Several bulletins regarding Sharree Marshall's appointment to the FCC have been going around in the past few days, and I wanted to clear up some mis-information in these messages.

First, Sharree Marshall's name has been withdrawn by President Bush as a nominee for the Chairman's position on the FCC. She is still one of his choices for the three vacant commissioner positions. The new nominee is Al Sykes, head of the NTIA. Her name was probably withdrawn for political reasons relating to her work with former chairman Dennis Patrick, whom the Senate Communications Subcommittee did not like, and also because she assisted the White House in the failed nomination of John Tower for Defense Secretary.

Second, Ms. Marshall is NOT an employee of UPS, as a recent bulletin and sample "letter to Congress" circulated via packet stated. She is an employee of a law firm specializing in telecommunications law, and UPS is one of the firm's many clients.

Third, Congress is not the place to address your input on this matter. The FCC is governed by the Communications Subcommittee of the Senate Commerce, Science, and Transportation Committee. Here are the senators who are

members of the subcommittee needing your input on choosing FCC commissioners:

Inouye Hawaii (Chairman, Communications Subcommittee)

Hollings South Carolina (Chairman, Commerce, Sc. & Trans. Comm.

Ford Kentucky

Gore Tennessee

Exon Nebraska

Kerry Maine

Bentsen Texas

Breaux Louisiana

McCain Arizona

Stevens Alaska

Pressler South Dakota

Packwood Oregon

Gorton Washington

Burns Montana

Address each piece of mail to an individual senator at:

(Senator's Name)

U.S. Senate

Washington, DC 20510

Do not try to use their individual office number. Right now a lot of them are changing offices, and the address above is best.

Keep your letter to the point, leave out any long harangues, and use a spelling checker if you have one. Don't accuse Ms. Marshall of doing anything wrong UNLESS YOU HAVE SPECIFIC EVIDENCE. Wild allegations do not help our cause. A suggestion that she may not possess the objectivity to regulate ham frequencies in the public interest may be sufficient.

I will forward more information as I get it. Hams in the states served by the above individual senators can have an especially strong impact.

The subcommittee staffer I spoke with today said that they will try to have the hearings underway before the end of July. If they miss that

date, then it will be after the recess and in the fall.

Fire up those word processors, but remember that a well thought out letter from an individual has a real impact. If a senator gets a bunch of identical form letters, it is a negative for us.

Good luck!

73,

Tad Cook

1461. Question on Heath HM 102

Newsgroup: rec.ham-radio
Date: 1989-07-07 22:11:36 UTC
From: barry@hprmokg.HP.COM
Message-ID: <13770015@hprmokg.HP.COM>
Source record: 18035

I just purchased a Heath HM-102 at a ham swap. The product is a
wattmeter for amateur radion transmitters.

Upon reading the calibration instructions (Page 14), I am instructed to:
"Adjust the transmitter output to 100 watts"

Now, if I could tell when my transmitter output was 100 watts, why would
I need a wattmeter?

Do they mean to adjust the *meter scale* to 100 watts deflection or do they
really mean transmitter output?

'Anyone own one out there with advice?

Barry

Howdy.
I am interested in getting the basic equiptment (transmitter,
reciever, and antenna setup) for short wave. What I want to know is
how inexpensively can I do this? What licence will I need? I already
have one when I use to DJ on a college AM radio station. Will that
suffice?

My main reason for starting is I have friends who are on mission
in various parts of the world (South America, Mexico, China, Africa,
Europe, and Israel), and I would like to have an alternate method of
communication.

Please mail responses since I may not get around to reading this
group right away. Thanks.

John

In INFO-HAMS Digest vol. 89, issue 445, Steve Sampson writes:
> 1227.6 MHz is the civilian Global Positioning Satellite (GPS) frequency
> L2 and 1575.42 MHz is L1. Will probably replace LORAN and VOR when
> fully functional.

For those interested in GPS, here are a few corrections and elaborations:

1. The name of the system is the Navstar Global Positioning System (GPS). It is a **multi**-satellite system.

2. 1227.6 MHz is not "the civilian ... frequency". There is no civilian frequency as such. Most civilian GPS receivers will be single frequency units using the C/A-code which is only transmitted on **L1** (1575.42 MHz). However, when un-encrypted (which should be most of the time), the P-code signal will be available to civilians on both L1 and L2.

3. Here is an excerpt from the 600-page Guide to GPS Positioning, which I have co-authored, summarizing the expected future of Loran-C, VOR, and some other U.S. navigation systems:

IMPACT OF GPS ON EXISTING
POSITIONING TECHNIQUES

Despite the warning that GPS is still a developmental system, and presumably risky to use, it has already had an impact on some positioning applications. Since static positioning does not demand continuous coverage, this has been the first civilian market for GPS. Control surveys and offshore oil rig positioning surveys using the Transit system are being phased out in favour of GPS. This is mainly because the data collection time to obtain the best achievable accuracy for GPS is hours, and for Transit days.

The eventual impact on other positioning systems depends on two factors:
* the mandates of the U.S. Federal Radionavigation Plan, and
* the eventual cost of GPS equipment and the market that it generates.

In the United States, as in most countries, responsibility for providing navigational services to the general public as well as to the military is vested in the federal government. The U.S. Department of Transportation (DoT), primarily through the U.S. Coast Guard and the Federal Aviation Administration, is responsible for civil navigation, whereas the U.S. Department of Defense (DoD) operates navigation systems for military users. Civilian use of many of the U.S. systems is worldwide, including some of the military systems. The systems currently operated by either the DoT or the DoD include Loran-C, OMEGA, Transit, VOR/DME, TACAN, ILS/MLS, radiobeacons, and GPS.

The DoT and DoD have been mandated by the U.S. Congress to reduce the proliferation and overlap of federally-funded radionavigation systems. The Federal Radionavigation Plan (FRP) was initiated in part to implement this mandate. The FRP delineates policies and plans for the U.S. government-provided radionavigation services. The plan is issued biennally, or more frequently if necessary. The latest (5th) edition was issued in December 1988 [U.S.DoT/DoD, 1988] . This edition of the FRP confirms the decisions by the DoD to phase out military use of some civilian navigation systems and to cease operation of selected military systems in favour of GPS. The FRP also describes DoT plans to possibly phase out (or phase over to the private sector) existing civilian navigation systems in favour of GPS. However, any final decisions will be delayed until such time as GPS becomes operational and there has been a suitable period of civil operational experience with that system.

Most military use of Loran-C and OMEGA will be phased out by December 1994. This phase-out date assumes that GPS will be fully operational by 1991. If it is not, this and other system phase-out dates may have to be revised. A decision on future civilian use of Loran-C and OMEGA will be made, based on consultations with national and international bodies concerned with navigation. In any case, operation of these systems for use by civilians is guaranteed until at least the year 2000. Loran-C is actually in an expansionary phase at present with two new mid-continent chains being added to complete Loran-C coverage of the United States. Military use of Transit is to be replaced by GPS by 1996. At that time, U.S. government operation of the Transit system will cease. Military use of VOR/DME (VHF Omni-directional Range/Distance Measuring Equipment) and TACAN (Tactical Air Navigation), which provide the basic guidance for en route air navigation in the U.S., will be phased out by 1997. However, operation of VOR/DME for civil use will continue into the next century. The transition already underway to convert ILS (Instrument Landing System) facilities to MLS (Microwave Landing System), for precision aircraft approach navigation, will continue. Maritime and aeronautical radiobeacons serve the civilian user community with low cost navigation. A decision on continued operation of these widely-used facilities will not be made for some time.

U.S. Department of Defense/Department of Transportation (1988). Federal Radionavigation Plan. Final report: January 1987-December 1988. U.S. Department of Defense document #DoD-4650.4 and U.S. Department of Transportation document #DoT-TSC-RSPA-88-4. National Technical Information Service, Springfield, Va, 22161, U.S.A.

If anyone would like information on how to get a copy of the Guide to GPS Positioning or would like a summary of the details of how GPS works, just drop me an E-mail message.

1464. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-07-08 20:40:30 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8907100400.AA18900@ucbvax.Berkeley.EDU>
Source record: 18038

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

1465. Re: FCC COMMISSION APPOINTMENTS

Newsgroup: rec.ham-radio
Date: 1989-07-08 22:27:02 UTC
From: kb7uv@dasys1.UUCP
Message-ID: <10150@dasys1.UUCP>
Source record: 18040

C'mon, now!

She works for a large DC law firm. She probably had nothing to do with the UPS 220 MHz action, and, even if she did, this still is not indicative of her personal feelings on Amateur Radio.

If we flood the Senate with oposition, and she is still confirmed (likely), she may well fell less than friendly to those who oposed her nomination.

What we (IMHO) should do, however, is contact our Senators with a different focus. Instead of ignorant oposition to a particular nominee, we wold do much better to remind our Senators of what Amateur Radio is, how it has served our state and country in emergencies and other public service, and then ask that ANY nominee to the FCC be questioned with regard to their feelings about Amateur Radio.

This won't piss off a potential FCC Commissioner, and will bring Amateur Radio into the discussion in a positive light.

Discretion is important when playing power politics. The FCC is national level power politics.

If you are unsure of what to do, contact your ARRL Director. Ask what the ARRL has done and will do, and ask if there is any constructive action you can take. You will find that the ARRL is on top of this issue, yet there may well be suggestions of what you can do to help.

e

1466. Re: Ham radio has its UPS and downs.

Newsgroup: rec.ham-radio
Date: 1989-07-09 05:15:46 UTC
From: brian@ucsd.EDU
Message-ID: <1827@ucsd.EDU>
Source record: 18039

I am becoming more and more convinced that ham radio seems to attract the kind of person who wants to be told exactly what to do by some authority figure - the kind of person who secretly wishes for some sort of thought control.

Or is it just that such a person feels he's been impotent to overcome the (largely imaginary) controls placed on him and wants others to suffer similarly so he won't feel alone?

It's probably another facet of the same personality disorder that makes socializing by ham radio (impersonal, insulated, without threat) so attractive to such people in the first place.

Thanks, Mark, for saying what needed to be said.

1467. * SpaceNews 10Jul89 *

SpaceNews

MONDAY JULY 10, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* UoSAT D and E *

Vibration tests for UoSATs D and E are scheduled this week on July 12, 1989 at RAE in Farnsborough.

* RS12/RS13 NEWS *

The new Soviet Amateur Radio satellites RS12/RS13 are to be flown on a COSPAS mission, much like RS10/RS11 were several years ago. The latest information indicates that the launch of these new satellites will NOT occur until on on-orbit navsat failure is believed imminent. This will probably not occur before November or December 1989.

* OSCAR-9 NEWS *

The current operating schedule for OSCAR-9 indicates that Diary software reloads will take place on Tuesdays, UTC. Digitalker telemetry will follow. The telemetry channels currently being downlinked by the Digitalker include:

08 : Battery Pack A Temperature (C)
18 : Battery Pack B Temperature (C)
22 : Battery Voltage +14V (Volts)
29 : Spacecraft -Y Facet Temperature (C)
35 : 145 MHz Beacon Output Power (UnCalibrateD)
39 : Spacecraft +Y Facet Temperature (C)
49 : Spacecraft +Z Facet Temperature (C)
59 : Spacecraft -Z Facet Temperature (C)

Here is a telemetry message spoken by the Digitalker and received at KD2BD on 06Jul89:

"This is Digitalker on UoSAT-1 in space. The time is zero two sixteen and twenty four seconds.

Number zero eight is minus zero six degrees C.
Number eighteen is plus zero six degrees C.

Number twenty two is plus thirteen volts.
Number twenty nine is minus thirty six degrees C.
Number thirty five is three four eight U C D.
Number thirty nine is minus zero two degrees C.
Number fourty nine is minus zero eight degrees C.
Number fifty nine is minus ten degrees C.

Please QRX and check number again."

As the temperatures indicate, the spacecraft was in darkness during this pass.
Note that the telemetry value for channel 35 is UnCalibrateD (UCD).
In order to decode the proper value for this channel, substitute the "N" value
given by the spacecraft into the equation : (N-82) * 1.67. The result (444 in
this case), represents the 145 MHz VHF beacon power output (in milliwatts).

* DECAYED OSCARS *

The following information lists the OSCAR satellites that have decayed:

Name | Launch | Decay
--------+---------+--------
OSCAR-1 : 12Dec61 : 31Jan62
OSCAR-2 : 02Jun62 : 21Jun62
OSCAR-4 : 21Dec65 : 12Apr76
OSCAR-9 : 06Oct81 : ??Sep89

* OSCAR-10 SCHEDULE *

Until 13 July

Mode-B: MA 25-225
OFF : MA 226- 24

14 July-Sept

Mode-B: MA 0-255

* OSCAR-12 SCHEDULE *

Date Mode Operating Period

13 Jul JA 1100 - 1912
15 Jul JA 1113 - 1925
19 Jul JD 0939 - 1751
22 Jul JD 1508 - 0804 (23 Jul)

* OSCAR-13 SCHEDULE *

Date : 14Jun89 until 16Aug89 | 16Aug89 until 16Nov89
Attitude: 180/0 | 210/0
Mode-B : MA 000 to MA 110 | MA 003 to MA 160
Mode-JL : MA 110 to MA 145 | MA 160 to MA 200

Mode-B : MA 145 to MA 255 | MA 200 to MA 240
OFF : % | MA 240 to MA 003
Mode-S : MA 150 to MA 160 | MA 210 to MA 222

Mode-B ZRO Receiver Sensitivity Test Schedule:

Sun 16Jul89 07:20 UTC
Sat 22Jul89 20:50 UTC
Sat 29Jul89 04:20 UTC
Sat 12Aug89 20:20 UTC

A downlink frequency of 145.840 MHz will be used for these tests.

Transponders will be in operation during the whole orbit from June 14 until Aug 16 due to excellent sun angle and power budget. There will no perigee operation between August and November due to perigee solar eclipses.

* 20th ANNIVERSARY *

On July 16, 1969, the manned spacecraft Apollo 11 (object # 4039) was launched from the United States and successfully orbited the moon, landed the first man on the moon in a lunar module and was later recovered on July 24.

In article <10150@dasys1.UUCP> kb7uv@dasys1.UUCP (Andy Funk) writes:

>Discretion is important when playing power politics. The FCC is national
>level power politics.

I couldn't agree more. I cite the case of the NRA who "targeted" several Congresspersons to unseat them. Metzenbaum (sp?) was one. They failed and guess who is sponsoring the "assualt rifle" bill. Let us not make the same mistake, hams are far less of a lobbying power than the NRA!

Hi:

I sent out a message to INFOHAMS the other day talking about some
recent problems we've been having here in Carbondale, Illinois with
a local amateur radio operator's view of SKYWARN nets. I also mentioned
the FCC's apparent lack of commitment to amateur radio emergency
services. I wanted to add a few more commebts. Today I received
several replies via BITNET and one phone call to the message I posted.
It seems that other people share my view about the importance of SKYWARN
nets and of amateur radio involvement during non-emergency times.
The phone call I received reminded me however, about how fragile the
understanding between the FCC, NWS, and other agencies really is.
It might be that my phone calls to the FCC seeking clarification on the
issue of providing communications on behalf of the NWS could be doing
more harm than good. That is, the FCC wants to keep their hands off this
issue. If an official complaint is filed they will have to take action
but in the meantime perhaps this issue is best left alone. I have no
intentions of becoming known as the ham who brought about an official
ruling that SKYWARN nets are illegal. I simply wanted to hear someone
at the FCC say that the FCC officially supports pre-disaster emergency-related
communications on amateur radio frequencies --they wouldn't say it.
Perhaps it *is* best to let the sleeping dog lie. Let's just hope he
doesn't lie in the middle of the road and get run over by the big wheels.

Bill, KI6DG, recently wrote: "I've been toying with the idea of
building a wx station in a high mountain area...it would give a
1 minute synopsis of winds, temperature, humidity, etc..."

Bill have you considered packet radio? Several outfits have weather equipment
(Heathkit) which have an RS-232 output and a smart storage capability.
Just hook on of these up to a TNC and transceiver and have fun.
All you need is a laptop computer at your flying location, TNC
and radio, and you're
set. Would be a good digipeater location, too, so you get more use for your
equipment investment.

I know your posting was a while ago, but it sometimes takes me awhile to answer
mail.

Subject: ft411 modif's
Date: 6 Feb 89 20:03:02 GMT

copied from packet KD6TH BBS
(Note: I have not tried or verified these mods, proceed at your own risk!)

From: 4X6TL@4Z4SV

Hello to all the owners of the FT-411 OF YAESU,

I have this Hand held, and by playing with it,
I discovered a nice trick to increase it frequency coverage.
It is so simple that you don't even have to open your hand held.
All you have to do is:

1. Make sure that the power switch is off.
2. press the UP arrow and DOWN arrow together, at the same time
(those keys are also called A, and B.
and they placed at the upper right side of the keyped)
3. Keep pressing both buttons and turn the power on.
That's all.
Now you can receive 130-174Mhz, and transmit 140-150Mhz
CAUTON: When you do this modification the memories can be
erased.
Ayhow I think it is not the end, and there are some more
options.
If you do have some more information about this Hand
held,
Please leave me a msg with it.

Tnx, AVIAD, 4X6TL@4Z4SV

Subject: FT-411 Modification.

From: 4X6TL@4Z4SV

Hi everybody.
Here is some new interesting info about the FT-411:
FT 411 OUT OF BAND MODIFICATIONS.
---

1) Open the front cover

2) Locate the C.P.U. unit (it is located on the
front cover).

3) Locate Jumpers 1,2,3 and 4 , These are the
band setting Jumpers

4) Jumpers No 1,2 and 4 should be
disconnected ,and Jumper No 3 should
be connected.

5) Close the radio .

6) Apply power to the radio and turn it
on.
The display will initialize with
memory No 1 flashing and the
frequency display will show
1.000

7) Now , adjust the display to
the desired lowest receive
frequency
When done ,press VFO.
The memory CH will now
show 2 flashing .

8) Adjust the display to the desired highest receive
frequency When done press VFO .
The memory CH will now show 3 flashing .

9) Adjust the display to the desired lowest transmit
frequency
When done ,press VFO.
The memory CH will now show 4 flashing

10)
Now , adjust the display to the desired highest
transmit frequency
When done ,press VFO.
The rig
is now set for your programed band on transmit and receive.

COMMENTS
---

1)
After the rig was programmed to the band and you want to change it
to
other ranges you will have to open the rig again and disconnect

Jumper No 3 then to apply power to the radio ,turn it on again
open it again ,connect Jumper No 3 back and repeat from steps 5 .

Any
comment and other information would be appreciated.

Good Luck
Aviad 4X6TL@4Z4SV

I want to build some heavy duty 420 MHz yagis for mountaintop use
and would like to find some software to assist in calulating the
yagi dimensions given the element diameters, # of elements, etc.

I would prefer to use elements shorted to the boom as that is
easier to build but insulated elements are not totally out.
Also, what matching networks are good performers and fairly easy
to construct?

I would also like any tips on good references to yagi design.

Thanks dudes (and dudettes)

1476. Ham "broadcasting"

Newsgroup: rec.ham-radio
Date: 1989-07-10 20:02:55 UTC
From: wmartin@ST-LOUIS-EMH2.ARMY.MIL
Message-ID: <8907110742.AA06464@ucbvax.Berkeley.EDU>
Source record: 18066

The recent SKYWARN discussion led me to wonder about several other aspects of ham radio that seem to fall under the category of "broadcasting". Do these come under the umbrella of the "QST" exemption to amateur radio being a two-way, point-to-point medium?

1. The IARN (International Amateur Radio Network) -- interestingly, I have heard the people who run this, when interviewed on Radio Canada International's "SWL Digest" program, explicitly refer to their transmissions as "broadcasting"! The info they transmit is of interest to hams and non-hams alike, in many cases, and is not the urgent safety-related data cited before when discussing the "QST" situation.

2. The code practice transmissions from W1AW (and I suppose there are other sources).

3. The RTTY transmissions of ARRL and CRRL bulletins.

4. The retransmission of space shuttle audio by amateur radio clubs.

I'm sure others will think of still more examples. None of the above are as important to public safety as the originally-cited weather-watch transmissions. If these are all OK, how could SKYWARN be subject to any question? What would that FCC bureaucrat say to all these situations?

(Isn't it about time that being a licensed amateur be a REQUIREMENT to hold any FCC position where the person's actions or decisions would have any effect on amateur radio? How else could they know what they are doing? So all Commissioners should have to be hams, as would all FCC upper-level management, and also all mid-level and action-officer types in the FCC section that governs ham radio would have to be hams. It would be a requirement before the person could be appointed or hired. There's a suggestion you can write your congresscritter about! :-)

>
The difference is in the "Business Transaction". A transaction needs two
parties. In this case, the establishment and the wife. When the wife
makes the transaction, Amateur regulations have no bearing, the husband only
suggested to her to order the pizza.

The "Indirection" you mention is the key. It would, IMHO, be better if the
husband only suggests having pizza would be nice and have the wife
understand to order it, though.

>This would make it legal to order food, or
>call a tow truck if disabled, while continuing to prohibit the use of
^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Calling for a tow truck IS legal. The prohibitions about business are
waved for "Emergency" (Life or Property endangered) conditions. When
your disabled on the side of the road there is a real probability of being
hurt (A friend of my wife, ended up with two broken legs and in traction for
several months from a roadside accident. He had run out of gas and another
car rammed his car on the side of the road, pinning him between the car
and guard rail).

Actually, _I_ get upset when I hear this sort of thing on the air
(particularly on a repeater I support). I indeed see it as the same
thing as making the call directly; both are third-party traffic as far
as I can see. Now, this does _NOT_ mean I disagree with the way you
would like to have things. But from what I can see, that's not the way
they are. In fact, as I understand it, we are prohibited from providing
communciations to expedite public not-for-profit events; that makes even
less sense to me. (The case you mentioned presumably could reduce the
revenue of commercial providers of similar mobile telephone service...)

In article <8072@cbnews.ATT.COM> res@cbnews.ATT.COM (Robert E. Stampfli) writes:
->Recently, a posting in this newsgrouop described a situation in which
->a ham was alienated because he made a phone patch to a business for the
->purpose of ordering food and apparently the patch was terminated. Now,
->I would personally like to see such things allowed, but I agree that there
->is consensus in the amateur ranks that such a phone patch is not acceptable.

I wouldn't like to see such things allowed; if I've just been in an accident
on the freeway, I don't want to have to wait until some turkey has finished
his call to Domino's Pizza before I can call 911 on the autopatch.

->Some of the most vehement supporters of this rule that I know, however, think
->nothing of calling their spouse and asking them to order the food -- achieving

->fail to see the distinction here. Why is one action illegal and the other
->not? Both have the effect of putting money in the food provider's pocket.
->What if instead of a spouse, it were a girlfriend? A secretary?

I imagine that one could rationalize this kind of transmission by saying
that the transmission doesn't relate directly to the pecuniary interest
of either party involved in the transmission. Not that I necessarily
agree with the rationalization, though.

Thanks for the rules passage.

So, it appears that the only redress available is to depend on an overworked FCC ? And the FCC has shown itself to be an undependable enforcer ? It would seem that our knight in shining armor is only a poor knave.

But, enough. The folks in NYC will have to deal with this. Out here in the high country we don't even have gypsy cabbies !

Well here is my two cents worth on this matter, and it is just that, a
personal opinion. I feel the FCC ruling on buisness communications through
an autopatch were designed to prevent buisnesses from using amateur radio
as a substitute (lower cost as well) for getting a commericial radio and
frequency allocation. I doubt that if joe ham were to order a pizza on his
way over to pick it up that the FCC would be waiting when he arrived there
to fine him and revoke his liscense (they might ask for a slice :-). I once
called my girlfriend at work, and somebody knocked down the patch because I
called a place of buisness, well needless to say I was pissed, as it was
a personal call (no buisness intended!). Anyway I have come up with a solution
to the bozo's that feel they should pass judgement on patches. I am in the
process of putting my own personal 6 meter repeater, and then I will decide
if my patch is acceptable or not. So you ask for comments, here are mine...

P.S. - All flames will be routed by Sendmail through an asbestos socket
to /dev/null...

2 Message entered 1989 07 10 23:12 2

This being my first time in this conference a warm 73's to all.

My question:I have an IBM PC XT and and an Epson compatible
printer and would like to build a TTY converter unit to use
via the computer/printer combination.

Does anyone know of a magazine article(s) referring to above?

What is a recommendable commercial unit(s)?

FIRST AMSAT 17M NET A SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 189.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 8, 1989
TO ALL RADIO AMATEURS BT

First Session Of The AMSAT 17M HF Net A Big Success!

The first session of the AMSAT 17M Net was convened Sunday, July 2nd at 23:00 UTC on a frequency of 18.155 MHz. Acting as Net Control Stations (NCS) were KO5I and N4QQ who worked together to commence this new Sunday evening AMSAT net operation. Much to KO5I's surprise, there were over 35 stations who checked into this "inaugural" session of the 17M AMSAT Net. In addition to the plentiful stateside stations, there were also DX stations from South America and Australia. Doug Loughmiller (KO5I) stated that one of the reasons why he and John Shew (N4QQ) wanted to start this net was because of the lack of QRM which generally plagues most of the HF AMSAT Nets and the many excellent DX openings which occur on this new band. Also, a with very modest station, e.g., a dipole antenna and 100 watts RF output, one can easily become very active with a simple station and do quite well on the 17M band. Doug has stated that the NCS's for this new AMSAT HF net will follow the same format pioneered by long-time AMSAT NCS, Jim McKim (W0CY). The first part of this net will be devoted to the dissemination of the AMSAT News Service (ANS) bulletins followed by a round-table discussion of the OSCAR operating activities by the participants of the net. This net also provides another opportunity for those who cannot listen to the AMSAT nets on Sunday afternoon to still find out what is happening in the world of amateur radio satellites. So on behalf of KO5I and N4QQ, all radio amateurs are invited to join AMSAT on Sunday evenings at 23:00 UTC at 18.155 MHz for this new AMSAT HF net.

[KO5I would like to request that for those who were monitoring to please send him a reception report to his home address: Doug Loughmiller, 620 Fairway Dr., Paris, TX 75460.]

AMSAT South Africa 10th Space Conference Set For August 12, 1989

The AMSAT-SA 10th Anniversary Space Communications Conference is set for August 12, 1989 at the Sandton Holiday Inn in Johanesburg. This conference will have speakers discussing all aspects of OSCAR satellite operations dealing with getting "Back to Basics" to educational aspects of amateur radio satellites, the MICROSATs, and to the latest technology issues. Featured guest speakers will include Geoff Perry of the world famous Kettering Group and Dr. Junior de Castro (PY2BJO). Geoff Perry will be discussing satellite monitoring and Junior will present a paper on Project DOVE (Digital Orbiting Voice Encoder). If you would like more information about this Space Communications Conference, please write to:

SILVER SPRING, MD JULY 8, 1989
TO ALL RADIO AMATEURS BT

New Area Coordinators Join AMSAT-NA Field Operations Team

AMSAT-NA Vice President of Field Operations, Jack Crabtree (AA0P), is happy to announce the following list of new appointees to the Field Ops Team.

NAME CALL LOCATION HOME PHONE NUMBER

Max Bodenhausen W0ZZQ Highlandville, MO (417) 587-3690
Gene Davies AA6NP Los Angeles, CA (213) 937-7942
Bob Gobrick WA6ERB Tracy, CA (209) 836-9160
Gene Marcus W3PM Huntsville, AL (205) 880-1237
Ed Stluka W4QAU Huntsville, AL (205) 852-3850
Harry Morton III WB2IBO Massapequa, NY (516) 541-1783
Ken Blanton W5CBT Amarillo, TX (806) 355-3234
Bob Douglas W5GEL Corpus Christi, TX (512) 852-2208
Jim White WD0E Littleton, CO (303) 979-7151
Robert Wright WB7CNJ Santa Rosa, CA (707) 571-8262
Van Sias WA7FAB Charleston, OR (503) 888-3341
Stuart Mitchell WD4ECK Medford, OR (503) 770-2835

In addition, the following individuals have been named Regional Coordinator:

Dave Cowdin WD0HHU Littleton, CO (303) 972-0648
(Region of responsibility includes WY-UT-AZ-CO-NM)
Harry Morton WB2IBO Massapequa, NY (516) 541-1783
(Region of responsibility includes NY-PA-WV-NJ-DE-MD)

All AMSAT-NA members are encouraged to become acquainted with your local Area Coordinator. The primary job of every Area Coordinator is to help beginners get started in OSCAR operations. Other duties include keeping you informed of the latest happenings and events in amateur radio satellite program. So contact your Area Coordinator today and find out what is happening; with more than six new OSCAR satellites to be launched later this year, you will very pleased you did.

AMSAT SUPPORTS SPACEWEEK 1989

HR AMSAT NEWS SERVICE BULLETIN 189.04 FROM AMSAT HQ
SILVER SPRING, MD JULY 8, 1989
TO ALL RADIO AMATEURS BT

AMSAT Supports Activities Commemorating 20 Years Since Moon Landing

To commemorate the 20th anniversary of man's first landing on the moon, many space oriented organizations are conducting activities during the week of July 15-23 known as SPACEWEEK 1989. In the Denver, CO area, for example, AMSAT-NA members are participating in these activities by displaying an AMSAT exhibit at the Arapahoe Community College on July 15th. This activity is being organized by the Front Range L5 and the Mile High L5 Chapters of the National Space Society. The AMSAT display will consist of a demonstration of tracking software, QSLs from satellite contacts, and a satellite ground station. AMSAT Vice President of Field Operations, Jack Crabtree (AA0P), encourages All AMSAT Area Coordinators and members to seek out and support local SPACEWEEK activities. There is still time if you act quickly. AMSAT wishes to impress upon the public and space organizations that we support the furthering of space exploration, and especially the education of today's youth in space sciences. AMSAT is an excellent example of the success of the private sector's participation in space and extensions to this success should be encouraged. Where will we be in 20 years from now? A Phase V repeater overlooking a space colony on the moon? It all depends on us.

AMSAT SHORT BURSTS

HR AMSAT NEWS SERVICE BULLETIN 189.05 FROM AMSAT HQ
SILVER SPRING, MD JULY 8, 1989
TO ALL RADIO AMATEURS BT

AMSAT SHORT BURSTS

AMSAT-NA Headquarters wants to remind members that nominations for the office of Director are now in order. According to the AMSAT-NA Bylaws (see ASR #187), four out of the seven Board-of-Director (BOD) seats will be up for

election this year. Any five AMSAT-NA members or any Member Society can nominate a member (who shall have agreed to serve if elected) for a seat on the Board. Nominees will be asked to provide minimal background and biographical data for publication in Amateur Satellite Report (ASR) and for inclusion with the ballot. Please send your nominating petitions to:

Secretary
Radio Amateur Satellite Corporation
c/o AMSAT-NA HQ
Suite #600
850 Sligo Avenue
Silver Spring, MD
20910

In accordance with the Bylaws, the deadline for receipt of nominating petitions by the Secretary has been extended from July 7 to July 14, 1989.

At the present time, the launch of the MICROSATs is scheduled for November 9, 1989. Since this falls within two days of the originally scheduled AMSAT-NA Space Symposium, AMSAT-NA officials have decided to change the date of this annual AMSAT event to the weekend of November 3rd, 4th, and 5th. If you would like to obtain more information about the AMSAT-NA Space Symposium, please contact AMSAT-NA HQ's at (301) 589-6062 or Ralph Wallio (W0RPK) at (515) 961-6406.

Courtney Duncan (N5BF), Manager of the AMSAT Operations Net, has issued the following new schedule for the next several months for the times and frequencies of the OPS Net. These nets on AO-13 are designed to discuss the many happenings in the world of Amateur Radio Satellites. If you have any comments or suggestions to pass along to N5BF, you can leave them to COURTNEY DUNCAN on the AMSAT-NA BBS at (314) 447-3003.

AMSAT OPERATIONS NET SCHEDULE 1989

Sun 30 Jul 0130 863 435.970 Saturday
Thu 10 Aug 0100 886 435.970 Wednesday

de DB2OS 01May89: *** AO-10 TRANSPONDER SCHEDULE ***
01May89 to 13Jul89

Mode-B : from MA 025 to MA 225
OFF : from MA 226 to MA 024

O S C A R - 1 3

Date : 14Jun89 until 16Aug89 ! 16Aug89 until 16Nov89
BLON/BLAT : 178.3/2 ! 210/0
Mode-B : MA 000 to MA 110 ! MA 003 to MA 160
Mode-JL : MA 110 to MA 145 ! MA 160 to MA 200
Mode-B : MA 145 to MA 255 ! MA 200 to MA 240

OFF : % ! MA 240 to MA 003
Mode-S : MA 150 to MA 160 ! MA 210 to MA 222

Transponders will be in operation during the whole orbit from June 14 until August 16 due to excellent sun angles and power budgets. However, no perigee operations will occur between August and November due to perigee solar eclipses! The 70cm and 2M omni-directional antennas will be used from MA 230 until MA 30.

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" has been reactivated. The following schedule of Mode "B" ZRO tests with a was chosen for convenient operating times and favorable "squint" angles. The frequency for the "ZRO Test" will be a downlink frequency of 145.840 MHz. AO-13 users who don't wish to participate in the ZRO Test are asked to avoid operating on or near that frequency during these ZRO Test times. Please post the following list of times in your ham shack for the ZRO Tests so that you will have them handy for quick reference:

Sunday July 16, 1989 at 07:20 UTC
Saturday July 22, 1989 at 20:50 UTC
Saturday July 29, 1989 at 04:20 UTC
Saturday August 12, 1989 at 20:20 UTC

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. of User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with one unit of postage. The brochure characterizes test procedures, means for obtaining certificates, and gives some historical background about the program. All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception.

/EX

Subj: Annual meeting registration info

RADIO AMATEUR SATELLITE CORPORATION (AMSAT-NA)
P.O. Box 27, Washington, D.C. 20044

20th ANNIVERSARY
1989 AMSAT Space Symposium and Annual Meeting
Des Moines, Iowa November 3-6, 1989
Hosted by the Central Iowa Technical Society (CITS)

The AMSAT meeting date has been CHANGED to accommodate
the MICROSAT launch now scheduled for November 9, 1989

To qualify for early registration prize drawing,
complete registration must be mailed by October 13th

The CITS-AMSAT'89 committee has arranged for a full weekend of AMSAT activities with low attendee cost a primary objective. In the tradition of past AMSAT meetings, there will be informal gatherings, presentations of papers on topics of current and major importance, a banquet followed by the 1989 annual meeting and a board of directors meeting extending into Monday.

- - - MAKE YOUR HOTEL RESERVATIONS - - -

Our primary hotel is the HAMPTON INN, 5001 Fleur Drive, Des Moines, IA 50321. Hotel reservations should be handled by attendees by calling 1-800-HAMPTON and mentioning the RAS GROUP for special room rates or, alternatively, by calling the Des Moines HAMPTON INN directly on 1-515-287-7300. Room rates are as follows:

	DOUBLE	KING	KING STUDY	SINGLE
1 person	$ 36.90	$ 36.90	$ 38.70	$ 34.20
2 or more	$ 42.30	$ 42.30	$ 44.10	$ 39.60

We have the whole hotel, all 122-rooms, for the entire weekend. Room rates include transportation to and from the Des Moines airport (a five-minute drive), complementary breakfast, free local calls and in-room movies and plenty of free parking.

If meeting attendance substantially exceeds our experiences of the recent past and the HAMPTON INN fills up, rooms will also be available at the MOTEL 6, 4817 Fleur Drive, Des Moines, IA 50321. Reservations may be made by calling 515-287-6364. Standard room rates will apply.

- - - MAKE YOUR AIR TRANSPORT ARRANGEMENTS - - -

Des Moines is served by AMERICAN, AMERICA WEST, BRANIFF, MIDWAY, NORTHWEST, TWA, UNITED and numerous feeder airlines. Flights are available for timely arrival on Friday afternoon or evening and departure on Sunday afternoon. Every airline has discount fares available but with the usual restrictions. Make your reservations early to capture the best deal and schedule.

- - - ALL LOCAL TRANSPORTATION PROVIDED - - -

Seminars, Saturday lunch and evening banquet, the annual meeting and the first board of directors session will be held in the executive conference facilities of the MEREDITH CORPORATION, 1716 Locust Street, Des Moines, IA 50336. These are first class facilities equipped with every form of audio and visual presentation support. All presentations will be video-taped and edited for future availability.

All required transportation between the HAMPTON INN and MEREDITH (a ten-minute drive) will be provided by chartered bus and the CITS transportation committee.

- - - MEALS AND REFRESHMENTS - - -

An informal, pay your own way, dinner and gathering will occur on Friday evening, 6-10:00PM, at the CRIMMINS CATTLE COMPANY Restaurant, 4901 Fleur Drive, Des Moines, IA 50321, telephone 515-287-6611. We will be in a special area with bar service and order from their standard menu with 15% automatically added to the tab for gratuities. The main bar will be open until 11:00PM. Reservations are not required. Arrive, eat and enjoy the camaraderie of other AMSAT members as your schedule allows.

HAMPTON INN room rates include a complementary continental breakfast.

As an option, we have arranged for Saturday lunch to be catered at MEREDITH. If you plan on eating lunch, this option is strongly recommended because we are scheduling only one hour between seminars. Limited transportation back to the HAMPTON INN will be available. Sign up on the registration form.

The banquet, to be served at MEREDITH, is also an option. We will be served family-style by one of Des Moines' premier caterers with soup, salad, roast beef and chicken, potatoes, vegetable, drinks and dessert. The 1989 annual meeting will follow this evening meal.

During the entire weekend, the CITS refreshment committee will be providing drinks and munchies in the HAMPTON INN hospitality room and at MEREDITH during seminars. These refreshments are included in your registration fee.

- - - OTHER THINGS TO DO - - -

There will be a spouse program on Saturday hosted by CITS families. Transportation to and tours of the Des Moines BOTANICAL CENTER, Des Moines ART CENTER, the Iowa HISTORICAL MUSEUM, lunch and a bit of shopping are currently planned. Please indicate interest on the registration form.

Des Moines is blessed with a number of entertainment possibilities including the Des Moines CIVIC CENTER (fine arts), the INGERSOLL DINNER THEATER and others. If such alternatives sound interesting for Friday or Saturday evening, make a note on the registration form and we will get back to you.

- - - MISCELLANEOUS INFO - - -

There will be a MESSAGE/NOTICE/FOR SALE board at the HAMPTON INN. Please bring pictures of your shack, antennas, etc. for everyone's amusement and amazement.

Seminars will be presented in a single-track schedule. You will not have to miss a thing. Informal sessions of the field organization and command station development program, among others, will be held during the wee hours in the HAMPTON INN hospitality suite.

Door prize drawings will be held at lunch and dinner on Saturday.

- - - THE WEEKEND SCHEDULE - - -

Friday, 03Nov89

5:00pm - 10:00pm Meeting registration (HAMPTON INN)
6:00pm - 10:00pm Informal gathering and dinner (CRIMMINS)
Noon - dawn Hospitality suite (HAMPTON INN)

Saturday, 04Nov89

6:30am - 8:30am Complementary breakfast (HAMPTON INN)
7:00am - noon Meeting registration (MEREDITH)
8:00am - noon Seminar paper presentations (MEREDITH)
Noon - 1:00pm Lunch (MEREDITH)
1:00pm - 5:00pm Seminar paper presentations (MEREDITH)
5:00pm - 7:00pm Attitude adjustment (HAMPTON INN)
7:30pm - midnight Banquet and annual meeting (MEREDITH)
Midnight - dawn Hospitality suite (HAMPTON INN)

Sunday, 05Nov89

6:30am - 8:30am Complementary breakfast (HAMPTON INN)

8:00am - noon Seminar paper presentations (MEREDITH)
1:00pm - late Board of directors meeting (MEREDITH)
late - dawn Hospitality suite (HAMPTON INN)

Monday, 06Nov89

6:30am - 8:30am Complementary breakfast (HAMPTON INN)
8:30am - 4:00pm Board of directors meeting (HAMPTON INN)

AMSAT-NA SPACE SYMPOSIUM CHANGE

HR AMSAT NEWS SERVICE BULLETIN 175.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 24, 1989
TO ALL RADIO AMATEURS BT

AMSAT-NA Officials Move Space Symposium "Up" One Week to Weekend of NOV. 3-5

Because of the scheduled launch of the MICROSATs on November 9, 1989 comes within two days of the AMSAT-NA Space Symposium, AMSAT-NA officials have decided to change the date of this annual AMSAT event. Those who have attended this Space Symposium in years past know that it normally "falls" on the second weekend of November -- and this year was to be no exception. But since many of the "key" personnel for the MICROSAT Program will be delivering papers at the Space Symposium, it was felt that it would be impossible for them to also provide support for the MICROSATs which would have only been launched 48 hours before the start of the Symposium! Therefore, in recogniz-ing this critical conflict between the launch and the Space Symposium, AMSAT officials have decided to move the Space Symposium ONE WEEK AHEAD to November 3rd, 4th, and 5th. Everything else will remain the same, that is, the location will be in Des Moines, IA, registration will be on Friday, seminars will begin Saturday morning, the Annual AMSAT-NA Banquet will be Saturday evening at 7:00 P.M., and the Board of Directors meeting will be on Sunday. With the launch of the MICROSATs this year along with UOSAT D & E, there will be many papers devoted to all aspects of these new OSCAR satellites. It is hoped by AMSAT officials that this change in the Space Symposium date will not prevent anyone who was planning to attend not to be present. At no other time has there ever been a launch of an OSCAR satellite scheduled within two days of this annual AMSAT event. If you wish to obtain more information about the AMSAT-NA Space Symposium, please contact AMSAT-NA HQ's at (301) 589-6062.

AMSAT-NA HQ Extends The Period For Submitting Board-of-Director Nominations

AMSAT-NA Headquarters wants to remind members that nominations for the office of Director are now in order. According to the AMSAT-NA Bylaws (see ASR #187), four out of the seven Board-of-Director (BOD) seats will be up for election this year. The seats on the "Board" which are up for election this year are currently filled by the following individuals:

1) Bill Tynan (W3XO)
2) Jan King (W3GEY)
3) Bob McGwier (N4HY)
4) Andy MacAllister (WB5ZIB)

Each Director will serve for a two year term. Any five "current" AMSAT-NA members or a Member Society, can nominate an individual for a seat on the "Board." Nominees will be asked to provide minimal background and bio-graphical data for publication in Amateur Satellite Report (ASR) and for inclusion with the ballot. Please send your "nominating" petitions to:

AMSAT-NA HQ
Suite #600
850 Sligo Avenue
Silver Spring, MD
20910

The NEW deadline for submitting petitions for your nominee to the AMSAT-NA "Board" has now been extended to July 30, 1989. AMSAT-NA officials felt that not enough time had been allocated for members to submit nominating petitions.

NEW AMSAT HF NET PLANNED FOR 17M

HR AMSAT NEWS SERVICE BULLETIN 175.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 24, 1989
TO ALL RADIO AMATEURS BT

Join KO5I & N4QQ For A New AMSAT HF Net On Sundays At 18.155 At 23:00 UTC

Doug Lougmiller (KO5I), President of AMSAT-NA, wishes to remind radio amateurs that the new 17 Meter AMSAT Net will commence operations on Sunday evenings beginning July 2nd, 1989 at 23:00 UTC. The frequency for this new 17M Net will be 18.155 MHz. The Net Control Stations (NCS) will be KO5I and John Shew (N4QQ). KO5I cited several unusual aspects about this band for starting this new AMSAT HF Net. Among the most important considerations which makes this a ideal band for HF Net operations is the lack of QRM. Another aspect of the 17M band is the unusual "openings" which make this band ideal for "DX" stations around the world. So start to prepare your station today so you can join KO5I and N4QQ on 18.155 MHz on Sundays evenings at 23:00 UTC. If you are unable to check into any of the several AMSAT Nets on Sunday afternoons, you will now have another opportunity late Sunday evening. KO5I and N4QQ are looking forward to seeing many OSCAR enthusiasts next Sunday on this "inaugural" session of the 17M AMSAT Net.

SB ALL @ AMSAT $ANS-175.04
AMSAT-NA BBS HAS NEW 40 MEG DISK

HR AMSAT NEWS SERVICE BULLETIN 175.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 24, 1989
TO ALL RADIO AMATEURS BT

AMSAT-NA BBS Has A New 40 Megabyte Hard Disk Installed

Mike Parisey (WD0GML) System Operator for the AMSAT-NA BBS reported last week to AMSAT-NA officials that a hard disk "crash" occured on the BBS computer and that he was temporarily using a smaller sized hard disk until a replacement could be installed. WD0GML is happy to announce today that the AMSAT-NA BBS has a new 40 Megabyte hard disk installed and the BBS is now back up to "full-strength." AMSAT-NA regrets any inconvenience which this temporary reduction in service might have caused BBS users. As always, the latest information concerning all the OSCAR satellites, operating events, Keplerian elements, and many other items of interests to radio amateurs can be found on the AMSAT-NA BBS. You can also leave messages for AMSAT-NA officials if you wish to do so on the BBS. In the first year of operation of the AMSAT-NA BBS, over 9500 calls have been made to the BBS. At the present time there are over 700 users which check into the BBS at lest once of month! Many of those using the BBS are from overseas, that is, calls have been logged from over all Europe, Japan, and Australia. AMSAT-NA appreciates the many hours that WD0GML spends to make this an excellent BBS for radio amateurs and OSCAR enthusiasts. If you haven't checked into the AMSAT-NA BBS lately, you can do so at (301) 447-3003. The BBS will support 300/1200/2400 baud modems.

HR AMSAT NEWS SERVICE BULLETIN 175.05 FROM AMSAT HQ
SILVER SPRING, MD JUNE 24, 1989
TO ALL RADIO AMATEURS BT

AMSAT Short Bursts

O S C A R - 1 3

Date : 14Jun89 until 16Aug89 ! 16Aug89 until 16Nov89
BLON/BLAT : 178.3/2 ! 210/0
Mode-B : MA 000 to MA 110 ! MA 003 to MA 160
Mode-JL : MA 110 to MA 145 ! MA 160 to MA 200
Mode-B : MA 145 to MA 255 ! MA 200 to MA 240
OFF : % ! MA 240 to MA 003
Mode-S : MA 150 to MA 160 ! MA 210 to MA 222

Transponders will be in operation during the whole orbit from June 14 until August 16 due to excellent sun angles and power budgets. However, no perigee operations will occur between August and November due to perigee solar eclipses! The 70cm and 2M omni-directional antennas will be used from MA 230 until MA 30.

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" will be reactivated in July. The following schedule of Mode "B" ZRO tests with a was chosen for convenient operating times and favorable "squint" angles. The frequency for the "ZRO Test" will be a downlink frequency of 145.840 MHz. AO-13 users who don't wish to participate in the ZRO Test are asked to avoid operating on or near that frequency during these ZRO Test times. Please post the following list of times in your ham shack for the ZRO Tests so that you will have them handy for quick reference:

Saturday July 1, 1989 at 21:10 UTC
Saturday July 8, 1989 at 04:50 UTC
Sunday July 16, 1989 at 07:20 UTC
Saturday July 22, 1989 at 20:50 UTC
Saturday July 29, 1989 at 04:20 UTC
Saturday August 12, 1989 at 20:20 UTC

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. of User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with one unit of postage. The brochure characterizes test procedures, means for obtaining certificates, and gives some historical background about the program. All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception.

URGENT HELP IS NEEDED IN LOCATING MICROSAT COMPONENTS

HR IS AMSAT NEWS SERVICE BULLETIN 182.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 1,1989
TO ALL RADIO AMATEURS BT

Urgent Help Is Needed In Locating Microsat Components

AMSAT-NA President Doug Loughmiller (KO5I), on behalf of the Microsat construction team, is appealing to the amateur community for help in locating some vitally important components to be used in the construction of the four Microsat satellites now under development for a launch later this year.

The construction phase of the spacecraft sub-systems is drawing to a close in preparation for spacecraft integration now scheduled to commence in the next couple of weeks.

AMSAT has exhausted all known sources for these components. The Microsat construction team is operating under a very tight time table and if this project is to be completed on schedule, it is absolutely imperative that the needed components be located and delivered to AMSAT by the end of this week.

The components that are urgently needed include two surface mount integrated circuits and a transistor all for use in the flight computer. They are as follows:

QUANTITY DEVICE
-------- ------
10 CD74AC00M
10 CD74AC04M
10 2N7024

If you can provide some assistance in locating these very important components, please contact AMSAT Assistant Vice President of Engineering, Bob McGwier (N4HY) at (609) 443-8963 or AMSAT President Doug Loughmiller (KO5I) at (214) 784-0194. Any help in this matter will be greatly appreciated.

SILVER SPRING, MD JULY 01, 1989
TO ALL RADIO AMATEURS BT

AMSAT-NA Board-of-Directors Nominations Period Extended to July 14, 1989

AMSAT-NA Headquarters wants to remind members that nominations for the office of Director are now in order. According to the AMSAT-NA Bylaws (see ASR #187), four out of the seven Board-of-Director (BOD) seats will be up for election this year. The seats on the "Board" which are up for election this year are currently filled by the following individuals:

1) Bill Tynan (W3XO)
2) Jan King (W3GEY)
3) Bob McGwier (N4HY)
4) Andy MacAllister (WA5ZIB)

Each Director will serve for a two year term. Any five AMSAT-NA members or any Member Society can nominate a member (who shall have agreed to serve if elected) for a seat on the Board. Nominees will be asked to provide minimal background and biographical data for publication in Amateur Satellite Report (ASR) and for inclusion with the ballot. Please send your nominating petitions to:

Secretary
Radio Amateur Satellite Corporation
c/o AMSAT-NA HQ
Suite #600
850 Sligo Avenue
Silver Spring, MD
20910

In accordance with the Bylaws, the deadline for receipt of nominating petitions by the Secretary has been extended from July 7 to July 14, 1989, rather than July 30 as erroneously stated in the ANS bulletin dated June 24. We regret the error.

W2PN BECOMES A SILENT KEY

HR AMSAT NEWS SERVICE BULLETIN 182.03 FROM AMSAT HQ
SILVER SPRING, MD JULY 01, 1989
TO ALL RADIO AMATEURS BT

Long Time OSCAR Enthusiast, Nat Schnoll (W2PN), Becomes A Silent Key

AMSAT-NA officials this week learned of the passing of a long-time AMSAT member and OSCAR enthusiast, Nat Schnoll (W2PN) of Upper Saddle River, NJ. Nat had been very active with all the OSCARS since the OSCAR 6 days. During that time, Nat made many substantial financial contributions to the Phase III Program. In his professional life, Nat was a successful engineer and industrialist. After retiring in the late 1960's and despite being in his 80's, he remained very active in amateur radio as a noted DXer and he was also an avid traveller, visiting all of the DXCC countries in which he had made contacts with. The only country in which he had visited but had never worked an amateur radio station there was Burma. That was the last country he need in order for him to have said that he "worked them all." Everyone who knew Nat regarded him as real gentleman. AMSAT and the Amateur Radio community will certainly miss him.

RS 12/13 LAUNCH DELAYED

HR AMSAT NEWS SERVICE BULLETIN 182.04 FROM AMSAT HQ
SILVER SPRING, MD JULY 01, 1989
TO ALL RADIO AMATEURS BT

Sources Indicate That The RS 12/13 Launch Will Be Delayed

As reported in the AMSAT News Service (ANS) Bulletins several weeks ago, the amateur satellite community had expected the imminent launch of RS 12/13. That report was based upon the best available information at the time. However, AMSAT-NA has learned from various reliable sources (including G3AAJ and KC2CF) this week that the launch of RS 12/13 has been delayed.

Like its sister RS 10/11, RS 12/13 will fly piggy-back on a civilian navigational satellite. This series of navigational satellites also perform a secondary mission known as COSPAS/SARSAT: search-and-rescue. As part of their secondary mission, these satellites collect doppler-shift data, for example, from downed airplanes which have their Emergency Locator Transmitters (ELT) running. This data is then used to "geo-locate" their position. These were the same series of satellites which helped locate the SKI TREKKERS during their journey from the Soviet Union to the North Pole and Canada last year. It is felt that the launch of RS 12/13 will not happen until there is a failure of one of the operational on-orbit COSPAS/SARSATs; when that occurs, RS 12/13 will then be launched. At this point it difficult to say when such a failure will occur. As soon as AMSAT receives any further information about the launch of RS 12/13, it will be made available as soon as possible in ANS Bulletins.

SPACE SYMPOSIUM DATE CHANGED

HR AMSAT NEWS SERVICE BULLETIN 182.05 FROM AMSAT HQ
SILVER SPRING, MD JULY 01, 1989
TO ALL RADIO AMATEURS BT

AMSAT-NA Officials Move Space Symposium To Weekend Of November 3-5th

At the present time, the launch of the MICROSATs is scheduled for November 9, 1989. Since this falls within two days of the scheduled AMSAT-NA Space Symposium, AMSAT-NA officials have decided to change the date of this annual AMSAT event to the weekend of November 3rd, 4th, and 5th. Those who have attended the Space Symposium in years past know that it is usually held on the second weekend of November. However, since many of the key personnel for the MICROSAT Program will be delivering papers at the Space Symposium, it was felt that it would be impossible for them to also provide support for the MICROSATs which would have been launched only 48 hours before the start of the Symposium! Therefore, in recognizing this critical conflict between the launch and the Space Symposium, AMSAT officials have decided to move the Space Symposium ONE WEEK AHEAD to November 3-5th. Everything else will remain the same: the location will still be in Des Moines, IA, registration will be on Friday, seminars will held on Saturday, the Annual AMSAT-NA Banquet will be Saturday evening, and the Board of Directors meeting will be on Sunday. With the launch of the MICROSATs and UOSAT D & E, there will be many papers devoted to various aspects of these new OSCAR satellites. If you would like to obtain more information about the AMSAT-NA Space Symposium, please contact AMSAT-NA HQ at (301) 589-6062 or Ralph Wallio (W0RPK) at (515) 961-6406.

N5BF Issues A New Schedule For The AMSAT Operations Net For AO-13

Courtney Duncan (N5BF), Manager of the AMSAT Operations Net, has issued the following new schedule for the next several months for the times and frequencies of the OPS Net. These nets on AO-13 are designed to discuss the many happenings in the world of Amateur Radio Satellites. Please note that N5BF has adopted a new policy on the scheduling of this Net. In previous months the OPS Net was normally held on weekends mostly for convenience. However, N5BF has designed this new schedule so that the Nets will occur in the evenings from 00:00 to 03:00 UTC. Also, pointing angles was another consideration in choosing these OPS Net times. It is hoped that this new policy for scheduling the OPS net will allow more AO-13 users the opportunity to check-in to this interesting net. If you have any comments or suggestions to pass along to N5BF, you can leave them to COURTNEY DUNCAN on the AMSAT-NA BBS at (301) 447-3003.

AMSAT OPERATIONS NET SCHEDULE 1989

Day Date Time Orbit Frequency Local evening, U.S.

Sun 9 Jul 0200 819 435.970 Saturday
Wed 19 Jul 0230 840 435.970 Tuesday
Sun 30 Jul 0130 863 435.970 Saturday
Thu 10 Aug 0100 886 435.970 Wednesday

-- orientation and schedule change --

Tue 22 Aug 0230 911 145.950 Monday

KD8WK:

>>Personally, I would like the see the prohibition against business practices
>>changed to a prohibition against the use of amateur radio for the pecuniary
>>gain of the amateur involved. This would make it legal to order food, or
>>call a tow truck if disabled, while continuing to prohibit the use of
>>amateur radio for conducting one's own business.

I've been thinking along similar lines, and I think this is an excellent idea. The vague present rules have spawned a whole cottage industry of amateur armchair lawyers who freely offer advice on whether a particular use of amateur radio is within the rules or not. The net result is that about the only uses that meet everybody's stamp of approval are 1) the contest QSO and 2) the banal ragchew. IHMO, rarely do these do much to further the Basis and Purpose of amateur radio, so perhaps it's no surprise that we're losing bands.

The rule that simply says "thou shalt not make money through amateur radio communications" is enough for me. Human nature being what it is, very few people (especially hams) would be willing to donate their own time and the use of their equipment in order to help someone else make money unless they could have some of it for themselves. So I would think that this would make any business abuses of amateur radio quite self-limiting. And determining whether or not someone is being "compensated" is probably a lot easier than whether the communication involves a "pecuniary interest to a third party".

But I guess this is too radical and novel an idea for a group that still opposes the concept of making licensing requirements more relevant to modern operating practices, eh? :-)

Phil

>

But, if I understand it correctly, you can call a tow truck if you
are disabled. What you can't do is call around for the best price.
The first is providing a road (hazard) service. The second is conducting
business for business sake.

What is the difference between calling my spouse and saying "Honey,
why don't you call Pizza Hut and order a pizza for tonight?" or saying
"Honey, why don't you order a pizza for tonight?" (knowing full well
that she will order the Pizza Hut pizza). I thought the injunction
against business use was a hold over from Ma Bell getting upset with
us for taking away business from her. In either case above, Ma Bell
is still getting my business (my wife still called) but Ma Bell has
not gotten my business over the air ways.

There was a discussion long ago (and probably many thousands of times) that
technically it is illegal to make a call on the autopatch (for any reason)
while I am (as an example) sitting at a stop light next to a service
station that has a pay phone. If this is the case, then the only use
of the autopatch is if you are out on a road where there is no reasonable
chance of seeing a payphone anytime soon. In other words, out in the
boonies (wherever that is :-)).

>call a tow truck if disabled, while continuing to prohibit the use of
>amateur radio for conducting one's own business.
Now this is where someone is thinking, I have to admit
that this point is well taken. I have heard similiar
conversions over the air (direct or through the patch) about
what the menu was and who to call to get the food.
Yet there is a opinion that it's ok to call a tow truck,
an aside:
{ I stopped for a stranded motorist on the expressway,
I was the first to stop (she'd been there for close to an
hour). Shortly after I had arrived th police drove by,
rolled down his window and asked me if I could help. I
said that I could and he thanked me and said that he had
a sh*t of calls to go to. I used the phone patch so that
she could call her mom at work for help, and some other
people as well, and her place of work that she would be
late}
There are opinions that what I did above would be considered
illegal, 1) third party traffic that could be construed as
business. 2) a business phone call - ie calling the office.

Yet I figured that I was well within the guidelines by provided
emgergency radio help for the safety and well being of the
public. (after all this was during a snow storm). Are we not
a public service. Or should we have CB's in our cars as well
so that we can help people stopped on the side of the road?
Maybe we should call a control operator and have them make the
calls on thye telephone?... hogwash, let's use our technology
and do the right thing via common sense.

I would support this idea about how to view the business
use of the repeater's phone patch.
Possession is nine tenths of the law, let's exeriment and
try out different things before we get possesed by others,
(the taxi's could gab the spectrum by this principle?)
Like alternative packet transmissions, why do we have to
conform the experiment?

Just a couple of ramblings of someone who's had to fight
for just about everything....

Source record: 18069

{ The one way transmission of code (notably by W1AW) is specifically exempt from broadcasting restrictions under CFR 97.113 (d) 3. This is straight out of my CFRs and reads as follows:

(d) The following one-way amateur transmissions are not considered broadcasting:

(1) Beacon or radio control operation
(2) Information bulletins consisting solely of subject matter relating to amateur radio;
(3) Transmissions intended for persons learning or improving proficiency in the international Morse code; and
(4) Emergency communications (see part 97.3 (w)).t(

As you can see, the code stuff from W1AW is legit.

I think that what is beeing missed here is that all (or most) of these decisions have been base on GREED. As I set here I wonder if the FCC is not just one more example of the kinds of things that have been going on in DC the past 8 years. I would be very supprised in HUD was the only agency rife with malfeasance, misfeasance etc. The possible appointment of Ms. Sharree Marashal is at least very cynical and probally more of the same "Hanky-Panky".

Just remember who voted this bunch in.

>4. The retransmission of space shuttle audio by amateur radio clubs.

The difference between these and SKYWARN is that they are EXPLICITLY allowed in the rules as exceptions to the "No broadcasting" exemption.

SKYWARN is an interesting case. By itself one would think that anything connected with SKYWARN is a good thing. Apparently the FCC views things a little differently though. The FCC believes that the repeating of weather bulletins in a QST format is the equivalent of repeating transmissions originating in another service which is prohibited. As I read the new rules I believe this is still prohibited, but announcing the weather in a Net conviened to watch for tornedo touch downs is a different kettle of fish. This qualifies as an "imminent emergency" situation, and would be ok, i.e. covered by the emergency communications provisions. (This isn't to say I like this limitation, or the new rules....)

I am interested in finding the cable pinout for a power supply that once accompanied a SONY Model AV-3400 Videocorder (AC Power Adapter AC-3400). The 13.2VDC power output cable is terminated with a 4-pin DIN plug. The chassis indicated that this is ``ISO''---presumably conforming to some ISO standard.

Does anybody know what the pinout for this cable is?

Thanks in advance,

>1. The IARN (International Amateur Radio Network) -- interestingly, I have
>heard the people who run this, when interviewed on Radio Canada
>International's "SWL Digest" program, explicitly refer to their
>transmissions as "broadcasting"! The info they transmit is of interest
>to hams and non-hams alike, in many cases, and is not the urgent
>safety-related data cited before when discussing the "QST" situation.

The IARN also does things like grant news interviews on the air
(I have a tape of one) in direct violation of explicit FCC
statements on the subject. Individuals associated with the IARN
have recently destroyed the 14.313 maritime net by challenging anyone
requesting a phone patch. I personally was the target of hate mail
which was sent to most amateur publications, and the FCC, as a result
of my participation in the Mexico earthquake, which the IARN disliked.
The FCC is afraid to prosecute the main individual in the IARN
for violating the news interview rule because he has a lot of
money and apparently likes to sue people at the drop of a hat.
He cost the FCC a lot of money in an unsuccessful suit to preserve
the 1000Watt input limit rather than 1500W PEP output (he is a
fan of ancient modulation). I have copies of many press releases
sent out by the IARN which all glorify K1MAN as a great hero.
Guess who sends out those press releases? So.... please don't
include IARN in a list of "legitimate" ham operations, even if
they do provide some assistance in emergencies.

Anarchy, I LOVE IT. Well in Canada, and I'm sure in the U.S., it is NOT the DOC (FCC) that decides what can be on a patch. Albeit, they do limit it with the NO-BUSINESS rule. It is the phone company! Our autopatch facilities are supplied with the good graces of the phone company and they have the ultimate right to revoke it. In fact we only have autopatch facilities mainly because many employees of the phone company are HAMs. If you abuse that privaledge supplied by the phone company, we all may loose it.

Now, the phone company is getting revenue from all these remote site phone patches. I hardly think they would revoke privaledges. But keep in mind that they may decide to treat us like children, if you cry too much, I'l send you all to your rooms, your all grounded until I feel better :-) :-).

I personnally feel that ordering a pizza is a no-no, but I will NOT dump their phone patch or complain about it (I just don't do it). Frankly the only thing I feel I can say on the phone patch is `Hi, honey, Il be there in three minutes, VE6MGS clear of autopatch :-}.'

Ciao, children 73 de VE6MGS

Source record: 17983

The difference between ordering pizza via autopatch and asking someone else to order the pizza on the autopatch seems simple, but it may not be. When you ask your friend to call in the order, neither you nor your friend are facilitating business for either party to the QSO (either of you, so long as you are not in the pizza business or a professional eater). If you call direct, the business of one of the parties to the QSO would be facilitated.

The last time I read the rule, however, I got the feeling the the communication was prohibited if the business of ANYONE was facilitated. Depending on how you interpret, you could make a very strong case that both of the above are against the rules.

Another problem area I have noticed is hams who have a radio or electronics business doing business on the air. Usually it is pretty subtle like, "the shipment arrived today" meaning the piece you ordered arrived and you can pick it up. Other times it is much more obvious like "I have that in stock", or "If you are in the market for yxz, give me a call". Of course, all of these facilitate the guy's business, but he is very unlikely to receive a citation. If someone points this out on the air one response is "well, I am not really making any money on the deal, anyway" which does not have anything to do with if you are conducting commercial affairs or not.

As in the pizza case, one could argue these are only "technical violations" of the rules. There is no evil intention and no one is really being hurt. Then again, a "technical violation" is still a violation.

>The rule that simply says "thou shalt not make money through amateur radio
>communications" is enough for me.

This is yet another time when dumb rules get put in because of extreme attempts to get around them! Remember Jim Jones in Guiana? They ham radio for communication with their "home base" because it was cheaper and easier than multi-national licensing of commercial equipment.

Unfortunately he was not the only offender, it became quite popular for a while.

At one time it was quite common to hear a whole bunch of "missionary" traffic which other than the fact that no profit was involved, was indistingushable from commercial traffic. "We need 2000 blankets, a ton of potatoes and ..."

This is what caused the rules to be rewritten.

There still is no prohibition against the traditional "Hi mom" personal traffic for missionaries or any other organization (like the Armed Forces) in remote parts of the world, but as things are now ordering a pizza and ordering a ton of supplies every week is really the same kind of thing.

I think the current rules say something to the effect of "not related to the primary occupation of either party". I think it could (and should) be worded to allow the pizza case without allowing the ton of supplies case, but that is really a different issue. We need to be careful though that someone doesn't set up an "on-line order entry system" using packet radio if we do get the rules re-worded. Looks like a lot of "catch-22s" here to me.

1507. CQ PIZZA

Newsgroup: rec.ham-radio
Date: 1989-07-11 23:06:42 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500052@ux1.cso.uiuc.edu>
Source record: 18076

If you really want to order pizza from your car, why not get a cellular telephone? If you find that too expensive, there are always phone booths.

Let's justify our spectrum allocation in terms of being a different service than land mobile and common carrier. Amateur radio has different purposes than for the convenience of licensed amateurs.

Casual conversation on the air, including talk about non-radio stuff, can be justified as a form of continuously using our radio stations to make sure they are always functioning the way we expect, and make sure we are very familiar with using our equipment. Ordering pizza is a little bit more than casual.

"A little bit more than casual" by who's definition? Not the average college student. Ham Radio is also a personal communications service, as well as for experimentation and saving the world. Allowing us to hack around and chat on the air is the price the government pays to have us buy and maintain our expensive "emergency services" equipment, as well as the best way to ensure that it will always be in good repair.

1510. TH-75A modifications please

Newsgroup: rec.ham-radio
Date: 1989-07-12 01:21:49 UTC
From: matt@pixar.UUCP
Message-ID: <5926@pixar.UUCP>
Source record: 17995

Greetings to all. A friend has picked up the new Kenwood
dual-bander handheld, the TH-75A. As it comes from the factory, it
will *almost* do automatic cross-band repeating. It is not automatic
because the PTT key must be held. A simple VOX-like outboard circuit
should make this feature automatic. But this works in one direction
ONLY, i.e., 440 in and 144 out OR 144 in and 440 out.
There is an ABC feature - automatic band change. This will swap
the sub-band with the main band when a signal is heard on the sub-band.
This together with the full duplex feature & you would think that you
could get a "remote-base" type of function from the rig. For example,
440 in, retransmitted on 144 AND 144 in and retransmitted on 440. However,
pressing the PTT will cancel the ABC feature. Sigh.
So if anyone in netland finds mods for these types of features
(or others too) I would like to hear from you. Thanks!
By the way, I got to play with it for an evening. What a *neat*
rig. I'm saving my pennies now.......

Well, here in Gringonia, where the FCC rules confused, it's like this. There is no such thing as Ma Bell anymore; her monopoly was terminated and later the company was subdivided for antitrust violations. Hams, however, still think it's 1955, and are bitterly debating whether or not transistors will ever replace tubes, now that Compactrons (tm) are able to put three tubes in one envelope! The main ham rag, "Keyer Monthly", is also debating whether or not iambic keyers should be allowed, or whether all hams should be forced to carry on all conversation using Vibroplex bugs or hacksaw-blade paddles.

So to be legal about it, there ain't nuttin' about the phone company's rules that should affect autopatches. I've seen such blithering garbage being uttered by hams who think things like, "phone patches aren't legal if it would be a toll call from where you are".

The Amateur Radio Service is not authorized for commercial purposes. Ordering a pizza may be construed as such, though it is a questionable call. Telling your spouse you want pizza for dinner is not commercial. Telling her you're coming home at night could equally be construed as a commercial for the real estate industry.

Not doing something because the phone company isn't making revenue is silly. The telephone company has a "common carrier" license, which means that they must deliver service to whomever asks and pays the tariff. Autopatch phone lines in the US aren't a privilege; they're bought and paid for. The only questions that arise are over which tariff applies -- residential is cheapest, and usually applies because of the no-business rule.

Once apon a time, there was an elite country club. For years it has entertained its members, and the town pretty much left them alone as long as they behaved themselves. But the town's population has grown, and with it has come increasing demands for scarce land. The country club's lavish real estate starts looking more and more attractive to others. Now this town is a bit unusual: it doesn't recognize private land ownership. It instead grants indefinite free use of parcels of land based on demonstrated need and potential benefit to the community, reserving the right to revoke those grants when it sees fit.

For a long time, the club had exclusive use of large tracts of land, mainly because nobody else wanted them (although the military had rights to many of them in times of emergency.) But over the past decade, the town has chipped steadily away at the edges of the club's land. Few complained much because the pieces weren't really being used anyway. Then one day the town tells the club that they must condemn one of their half-completed prime golf courses to make way for a UPS depot. Frantic appeals to the town council (whose members are not members of the club, by the way) are fruitless, despite somewhat stretched attempts to demonstrate the value of the golf course to the community as an emergency shelter area and National Guard training facility (and calling Dan Quayle to testify to the latter point).

Everything hits the fan as the club quickly splits into two factions. One wants to stave off further land losses by boosting the club's membership and improving its snobby, elitist image in the community. It proposes an overhaul of its qualifications for club membership, retaining only those that ensure that a new member is capable of using the club facilities safely and effectively. The other faction violently opposes this, citing the club's tradition of "hard work", the decline of public morals and a fear of being unable to use the golf course whenever they want. It refuses to agree to any lowering of its membership standards as a matter of principle, even if that results in further losses of land.

Which do you think is the more reasonable and forward-looking faction, and why?

I think the point is that this is blatently a commercial use having nothing whatever to do with the "basis and purpose of the Amateur Service". Not that the "mindless gab" is a whole lot better, but it is at least not performing a service for which there is another form of license!

I leave the socially redeeming value of Jim Jones' adventures to others to defend. The basic argument was that "if its religious it must be good" BTW.

The current rules say NOTHING about "for profit" because of the "missionary
traffic problem. Don't know about getting information for your personal use,
I see no harm in it personally but I don't work for the FCC.

In short the profitability (or US taxation class) of an organization is
irelevant.

Question:
Why buy a Cellular phone?

Answer:
So you can order a PIZZA from Domino's and out run the delivery
boy untill it is free!

(This is not an offer to buy nor a solicitation to sell, such as might be found in rec.ham-radio.swap -- hint, hint. :-)

I'd like to restore one that I picked up. It needs some buttons and a front panel, and the walnut cabinet is scratched. It seems to need to "warm up" several minutes before it will achieve lock. I managed to get the manual, but Heath doesn't stock parts for anything that old (~20 years). Call me old-fashioned -- I like having the world's first commercially available digital FM tuner!

Would anybody who has (or have had) one of these please contact me for advice, mutual support, etc., especially if you've repaired it or know where parts might be found?

I agree wholeheartedly. It appears to me that, over the years, hams have
been over eager to take the view that it has to be "ham radio for ham radio's
sake", and by necessity, to avoid offending anyone's idea of what communication
as a "hobby" can be , that we have digressed to the current level of crap
that is present on most bands. This includes not just avoiding the appearance
of commercialism, but of avoiding anything at all controversial, political,
and generally, useful in terms of things to talk about.

I think it would be very easy to distinguish in real terms, "for profit"
and "not for profit" activities on the air, just as it is for tax purposes.
There will always be some abuses over the air, just as there are in other
areas, but that doesn't mean that the entire amateur service will be held
accountable for them, or will be punished as a result: the fact the some
churces have engaged in frankly commercial activities has not led to repeal
of the tax-exempt status of such groups as a whole.

If it really came down to it, I suspect that the commission, and more likely,
the courts, would take a more liberal view of amateur activities than
amateurs themselves do.

How did he know it wasn't an emergency? What if some suicidal person said
he wouldn't kill himself if someone ordered him a pizza? OK, that's a little
far fetched but as I understand it, you can't use ham radio like a business
band radio (like a pizza parlor telling the delivery boy where to go). Calling
for pizza is not a business.

Chris Novy wrote in a recent note: Just let the sleeping dog lie.

Reading this made me wonder, why is it that everytime someone can put a scenario together they call the front office of the FCC? We are supposed to be a self-policing group. That is sure not the impression were leaving with them! We don't need any more of their recent 'help'.

What is wrong with addressing these questions through channels?

One of those channels is through the Amateur Auxiliary. Contact can be made with the local Official Observer and they could pass the request on to their Regional Monitoring Station. If the RMS could not answer the question directly, using that persons contact with the commission would seem to better answer questions then calling Uncle Sam.

By no means is the Amateur Auxiliary a "secret" organization. Give them a call, (don't everyone call me) they are there to help amateur radio's cause. How many other "OO's" are out there in net land?

> nications or signal.
>
> That pretty well sums up the whole approach. It doesn't seem
> to matter whether the signal is legal or not. If your causing
> willful interference, then you too are in violation.

This is actually still a rather vague definition. In order to constitute interference, some degredation of the other communications or signal must occur.

If I am transmitting a signal from point A to point B, which is part of the communications between points A and B, and someone else at point C was trying to listen in when yet another ham at point D communicates to a ham at point E using the SAME frequency in such a way that A-B and D-E do not affect each other, but C just gets noise, then that is definitely NOT interference as I define it. The person at C might disagree.

Now if the ham at D was unaware of communications A-B and transmitted to the ham at E who was also unaware, then that is interference, but it is NEITHER malicious nor willful; it is simply unfortunate.

If an illegal communications is taking place between a taxi driver and his dispatcher on an amateur frequency, and a ham initiates a transmission that he knows will cause interference, even if he has a legitimate purpose as well, then it is willful, and possibly also malicious, interference.

Suppose the ham knows that the taxi service is only using a single frequency and during time that no communications are taking place, initiates the transmission of a signal or communications of his own for a long period of time (after checking to make sure the frequency is clear), then no interference is taking place, yet. When the taxi service transmits, it is they who are now causing the interference. If there is any issue of who is causing the interference, which would have to be decided in a court, I am sure it will be decided in favor of the legal operator.

The issue of interference is a tricky one. Quite often both operators are legal and both operators have an equal claim or access to the frequency. This is why the FCC has said it will favor a coordinated repeater of an uncoordinated one; they need to examine who made the greater effort to see to it that their signal was not going to cause an interference.

> in three minutes, VE6MGS clear of autopatch :-}.'

If it was my repeater/autopatch, I would dump it, and I would explain/complain,
because it is MY responsibility as well, as operator of the repeater. Since I
interpret the "contract" of ording a pizza as legally being "business", and it
is not of an emergency nature, then I see it as violating FCC rules. I would
bet it is not too much different in Canada, but I don't know for sure.

I was unhappy with the FT-411's "3" mode because the frequency had to be entered starting with the 100 MHz digit, and the ARS function would not work. I now use it in the "2" (normal) mode with the following mod. I used the "clone" mode to dump the FT-411's ram to a computer. It's 9600 baud, 1 start bit, 1 stop bit, CMOS logic. 544 bytes are dumped when the up arrow is pressed. Starting with byte $211 are the upper and lower transmit and receive frequencies, stored in BCD. I changed these to the limits I wanted. My FT-411's upper PLL limit is 195.4 MHz, so I used 195 MHz. The lower limit MUST remain set to 130 MHz (magic number) or the keyboard entry of frequencies will start with the 1 MHz digit .VS. the 10 MHz digit. To put the data back into ram, just press the down arrow and send the new 544 bytes to the FT-411. You could also just clone an H.T. that has the limits you want. You can not clone a mode "3" H.T. to a mode "2" H.T., however. The mode is contained in the first byte, which must match.

From: MPARISEY
To: IS
CC: DCOWDIN, DLOUGHMILLER, NCS
Subj: BALLOON LAUNCH 7/22/89

Hi Dave and NCS's, attached is the BALLOON LAUNCH story posted to the AMSAT-NA CBBS by Doc W4ITJ. Its going up on the 22th of July, see story for details. You may want to attach it to your Bulletins this week. Dave the second time was a charm HIHI.

Balloon Launch Scheduled for July 22:

An instrumented balloon is scheduled for launch from the Knoxville/Oak Ridge, TN area between 7 and 8 AM on July 22 in commemoration of the 20th anniversary of the first lunar landing and moon walk. Radio amateurs Carl Lyster, WA4ADG, and David Fields, N4HBO, have announced this as a combined exercise of East Tennessee hams and the Civil Air Patrol.

Three transmitters with their lithium battery power supply make up the two pound instrumentation package. The launch vehicle, a 12 foot weather balloon, is expected to reach an altitude of 100,000 feet before bursting. At that altitude and based on previous balloon data the signals should be heard from distances approaching 500 miles. The main transmitter, operating on FM at 2.5 to 3 watts, will be on a frequency of 144.34 (if the xtals arrive in time - otherwise on 146.52MHz)and will consist of station identification, temperature and power supply telemetry, and digitized historical information. The latter consists of President Kennedy's address to congress authorizing the manned moon program as well as the voice of astronaut Neil Armstrong at the time of the first manned moon landing. Digitized information and telemetry signals will conform to 1200 baud packet standards. Also, standard ASCII telemetry will be sent at 300 baud with 7 data bits, 2 stop bits and no parity with modem tones of 1200/2200 Hz with the start bit at 2200 Hz. A second transmitter operating on 28.866 MHz at 0.25 watts will provide identification and telemetry data on CW at 7 wpm. Transmissions will be repeated at 2 minute intervals. A third transmitter will consist of a small Emergency Locator Transmitter operating on the air distress frequency of 121.6 MHz. This will be used by the CAP as a tracking exercise from both air and ground locations. This, hopefully, will aid in recovering the package which will return to earth via parachute.

Monitoring stations should note altitude and azimuth bearings, along with times, and should monitor both the 2 meter and 10 meter signals to observe fading characteristics as the balloon moves behind mountains and over the horizon. Remote observers are urged to record the received signals and to make their tapes available to Carl and Dave for subsequent analysis. A special net covering the event will meet on a frequency of 7.155 MHz starting an hour before launch.

Announcements will be made before launch on local repeaters, packet radio, packet DX nets, and HF nets. Send a note with your call and home bbs if you are interested. Contact Carl at (615) 588-7120 or Dave at (615) 482-5155 for more information.

I think just about ANY sane person would take a more liberal view than
most amateurs do; I have never met a more hidebound, conservative,
pharisitical, government-fearing group of little old ladies than my
fellow hams.

When was the last time you met a ham who believed that it was easier to
obtain forgiveness than permission? Is this the way America became
great? By quaking in fear that someone somewhere might not like what
you do - or think?

Source record: 17998

I spoke with W8RC (ARRL Great Lakes Director) this morning and asked him if the League was going to take a position on the Marshall nomination. His answer was that they decided that if they opposed the nomination and won, which was not likely, they'd alienate the Prez at a time when they needed his support on the 220 issue (and others), and if they opposed and lost, they'd have an enemy on the FCC for a long time.

Whether or not you agree with this logic, it's clear that it's up to the individual to oppose this nomination. I suggest writing to your senators and congressmen *AND* phoning them as well. You might also drop a line to Senator Carl Levin of Michigan. He recently sent a mailing to hams outlining his support for this constituency. A few thousand letters that he can wave around might not hurt.

Source record: 17999

I have a lot of respect for KA9Q, but I have to differ with him on what should, or should not be allowed on the radio. While he's absolutely right about the prohibition on business communications being there to prevent the bands from being used as another set of business bands, I think we have to take an (ahem) conservative position here.

The rule he and others propose, that no communications be allowed to the monetary benifit of the ham, is, well, full of holes. It allows, for example, business communications to be passed by NTS nets. That's extreme, but it falls under the definition. It would also make pretty much make 2 meters a substitute for cellular phone, with constant patches ordering food, checking on prices at the local ham shop, calling in to work for messages, etc...

Okay, so much of radio conversation is banal. But we need to keep a strict demarcation between amateur radio and the commercial services; otherwise, we lose the justification for amateur radio. I fear that if we loosened the rules as Phil and others suggest, we'd lead to a situation in which the commission could rightly say that we were using our allocated bands for purposes best served by common carriers...and why don't we just turn over 2m, 220, 70cm etc to the cellular service so *all* could share?

In the lastest rule book from ARRL, there is a letter from the FCC about
this. It states that the commerciality is the key part. It doesn't matter
whether you are calling a part warehouse to find a part (for-profit) or
calling Salvation Army store to buy a widget (non-profit). They are
BOTH construed as commercial.

Has anyone been able to figure out key sequences or modifications for the new Yaesu 470 handheld?

I have been able to expand the receive range on VHF to 130 to 180 but would like to expand VHF transmit and UHF transmit/receive. Also, has anyone discovered any tricks like repeater function or other neat things?

It is generally a great little radio but is more susceptable to intermod than the 727 was.

P.S. I realize there are "type accepted" restrictions so no flames please.

Thanks and 73.

> - Brian

Gad Brian! We agree yet again!! This is scary :-) I think the problem goes somewhat hand-in-hand with the advent of mass geezing in the ham ranks. As the agressive young hams of the '40s and '50s turn into the geezers of the '80s and '90s, we see more and more of this fear to change.

I think what we have to do is force the issue in spite of the geezing. The rules are vague and enforcement is from within to allow flexibility. We have seen the FCC's response to our failure to exercize flexibility in issues like no-code.

I personally don't want to see the local Century 21 office dispatching real estate scuzzies via ham radio but I think the distinction between that kind of activity and what we're talking about is rather distinct.

The solution is very simple. If you think an activity is permissible, and you do a reality check by running it by a few friends, then DO IT!
If you find yourself geezed on a repeater, then either organize enough support to take control of the club or erect your own.

I'm just simply amazed that I see debates like whether or not calling a tow truck is permissible. Or whether or not the rules restrict us to 56kbaud or 56kbps. And of course, the worst ones are those who actually call the FCC for an opinion. I was told by an FCC official a few years ago that the automatic answer to ham rule inquiries would be NO! They just don't want to fool with it. Come on guys, we can do a LOT better than that!

The plain fact is the FCC just doesn't give a shit! We don't represent a political force, are surely not a source for political contributions, our "technical contributions" pale against the output of even a junior college, and our emergency services could probably better be done on GMRS. And the issue of the year is whether or not we throw out a ancient, 200 year old signaling technique in order to spur some new blood.

We are simply viewed as caretakers for frequencies until other interests need them.

But let's consider for a moment the event that someone complains to the FCC and they act. What happens? Well, unless your activity is something criminal like selling coke over the radio, you get a little warning slip telling you to quit whatever it is you are doing. Simple as that. No fine, no electric chair, just a warning. So you don't do it any more. End of story.

Lest someone think that I'm an anarchist, nothing could be further from the truth. I fully support obeying the rules. I just cannot support the quake-in-your-shoes attitude that pervades the ham ranks at the moment.

Of course if we remain as we are now, our caretaking role will become smaller and smaller. Kinda tracks the decline in ranks, eh?

How about ordering a Pizza for a Ham Radio Club meeting??? In this case
you are getting goods to help support Ham Radio and not much differant
than talking about getting a new repeater on the hill...

Just a thought to stir things up a bit!

Thank you for raising the subject Perry. I am aware of both situations
that you spoke of. The whole idea of my basenote was to get people
used to the idea of taking questions, and in this case, complaints
through the Amateur Auxiliary network. The Regional Monitoring Station
has an excellent working relationship with their local FCC field office
and can act together on information provided by Observers. It is aways
best for all parties involved to resolve a problem at the lowest level
required. A case in point was the recent action against an amateur in
Washington state. The Observer, Regional Monitor, and local FCC office
worked very well together. The case was reported in the latest issue
of QST.

I should clarify one point. The Regional Monitoring Station is NOT the
regional FCC monitoring site. This station is another link in the
Amateur Auxiliary chain.

For those involved in the NYC 10meter problem, I can only say call your
ARRL section manager and find out who the local Observer is and CALL THEM.

On your other concern, as an Observer I can make no comment at this time.

>would be a violation if I were to use the patch to check the bus schedule.
>It most definately would not have been a business transaction, and the
>local transit system is not a for-profit outfit. It seems completely legal
>to me. Comments, anyone?

Look around at the Bus stop... Is a phone nearby? If so then you are
technically in violation.... But it is hard to show this...

I am sure there are other arguments also...

Personally I think that we are abit over zelous about the AutoPatches...
We are very worried that they will get perverted and turn into a business band.
Having a guy order a Pizza, or calling home to tell his wife he will be home
for dinner is no big deal... Let us worry about new modes of communication
how to protect our spectrum, getting new Hams in the Hobby and above all...
Having fun and helping people...

The difference is that one of the parties to the pizza qso is in the pizza
business and neither ham swapping/selling equipment is in the radio business.
In fact, the swapping/selling would be legal as long as no one's regular
business is being facilitated. At least that's my interpretation.

I don't understand. How is interrupting John Q. Amateur calling
Domino's on the autopatch to place an emergency call any different
from interrupting him if he's calling his wife to tell her he's
running late? I seriously doubt that John Q. will have any trouble
giving up the pizza call to let you call 911.

>furniture instead..." At least the "missionary" traffic you mention probably
>helped some starving kids in a third world country.

Yes, it is. If the missionary traffic were allowed, then that would open
the door to others who wished to use the amateur frequencies in ways
outside of the basis and purpose. There would be no difference between
that and, say, a geophysical company who set up a not-for-profit
subsidiary, had its communications employees get ham tickets, and
transfer them all to that company. They could then order the ton of
potatoes for the parent company, and be within the rules.

The anti-commercialization rules are intended to prevent the amateur
bands from being used by users who should be in a business band instead.

Marc Kaufman posted a reply to my description of a problem we were/are having with a local amateur radio operator's disapproval of SKYWARN nets and my contacting the FCC. Marc, I'm not afraid that the FCC is going to come crashing down on me. I realize that we don't see amateur radio operators getting hauled to jail for minor violations all the time. Here's what happened. We've been running our SKYWARN net for 10 years. For the last 5 years we've been running it out of our local emergency services agency (ESDA). The relationship between the local hams and the city ESDA has been mutually beneficial. We've made our nets very professional and stick to strict net control guidelines. Now enter Mr. Jerk. He's been licensed for 6 months, has a Technician class ticket, and thinks he knows everything about ham radio because he was smart enough to copy 5 WPM Morse code and pass a couple of simple written tests. His idea of ham radio is a bunch of old farts sitting around drinking coffee and talking about their antennas all day. He thinks SKYWARN nets are bad because they aren't fun and he doesn't understand net protocol. He also got mad at me because I informed him that calling MacDonalds and ordering lunch on the autopatch, when other means of doing this were available, was illegal. So he decides to get even and go after the one favorite thing in my life besides sex --SKYWARN. He gets a friend of his to interrupt a SKYWARN net during a tornado watch and recite FCC rules regarding broadcasting. He then writes a 10 page letter to our club saying that we (the club) and the individual operators are "clearly in violation of FCC rules" and that if we don't stop he's going to file complaints with the FCC. We try to explain to him the problem and that we are not broadcasting but he wouldn't listen. To gather a little supportive evidence I contact the ARRL and FCC. I'm told two different things; 1) it's legal and 2) it may not me legal. The FCC tells me I should write for an official interpretation. I figured, Mr. Jerk was going to file a complaint and I'd rather get my side of the story in first --before we were ordered to stop. I realize, especially now, that the FCC isn't the place to get problems solved. I was and still am convinced that we were not broadcasting. The problem now is whether conducting data collection for our ESDA or weather service is considered carrying out their regular business. Amateur radio has played a extremely important role in local and regional SKYWARN activities. There is no official understanding between the FCC and NWS regarding SKYWARN nets that I know of. I don't want to see some jerk complain to the FCC and have them turn around and say "gee...it *is* illegal to directly support another agency during non-emergency times". As I said, I dont see the FCC ordering me to stop but I don't want to see the ground between FCC and NWS get any worse. I personally see the FCC trying to minimize the role of emergency communications in order to make it harder for hams to justify maintaining their VHF frequencies. Should the FCC say SKYWARN nets are

in violation of FCC rules (let's just say they did), it would be pretty hard to justify our emergency communications role. After all, how many disasters do we have in this country each week where the entire normal communication system becomes so overloaded or destroyed to a point where ham radio is the only means for communications. I realize that calling the Sheriff to report an accident is a form of emergency communications but do you really think that it justifies us keeping all of 6m, 2m, 220, 440? What I'm saying is that if we keep going on thinking how bright and innovative we hams are and how useful we will be when the "big one" hits, without doing something meaningful to justify our frequencies, we will see the VHF bands taken away from us one by one. I don't want to see SKYWARN nets ruled illegal (and they very well could be if you want to interpret the rules as such) so that the FCC and business interests have another excuse for chopping more spectrum space.

I thought I would let you all see the letter I received from the FCC in regards to my request for an official ruling. My basic questions were;

"...is running a severe weather net, receipt of information from amateur radio storm spotters, and reading of severe weather statements to the net (without specifically addressing any one individual) in violation of FCC rules and regulations?"

and

" ...can we legally; 1) automatically transmit selected NWS weather products via radio-teletype using a computer program as the control operator function and 2) can we legally transmit selected NWS weather products {originally} provided through a non-amateur data service via radio (satellite) if the products are first written to disk by one computer program, altered to include callsign and additional product information, then transmitted under the control of a second computer program."

The first question is related to Broadcasting. The second is related to retransmission of signals emanating from another service.

In response to my questions, John B. Johnston Chief of the FCC Personal Radio Branch wrote me saying:

"Your questions relate to the issues considered in PR Docket No. 88-139. See the REPORT AND ORDER (Order) adopted May 31, 1989. In its comments, which are quoted in paragraph 19, the ARRL stated that the amateur service needs flexibility in the rules in order to permit the widest range of experimentation and public service, while requiring protection against encroachment. The new rules attempt to meet these needs."

"It is unclear that the {watch/warning statement} messages you describe are appropriate, on a less-than-life-threatening basis at least, for transmitting in the amateur service. I suggest that you review the Commission's general policy on amateur stations providing emergency communications in paragraph 26 of the Order and the rules for providing emergency communication in the new Section E of Part 97 of the

Commission's Rules, 47 C.F.R. paragraph 97.401 - 97.407, in light of the scope of the communications you wish to transmit. Then you should discuss the matter with your fellow amateur operators and ARRL officials.

I trust this is responsive to your inquiry".

Well you figure out what he said. I interpret it as "use your own judgement" and that the FCC isn't going to make a ruling on the matter one way or the other. While not conclusive, I feel that our SKYWARN operations are, at least, not-illegal. I intend to let the matter drop. We will deal with Mr. Jerk at our club meeting tonight. If he doesn't come around to our way of thinking then he'll be an ex-member. I received several letters from people saying "keep up the good work". I intend to continue using amateur radio for SKYWARN nets and plan to continue gathering severe weather information for my local ESDA and NWS using amateur radio until officially told not to.

In summary Marc, I didn't really want to contact the FCC but felt that it was best to get this matter settled in a manner other than one ham saying he interprets this as legal and another one as saying it's not. I agree there's more to ham radio than SKYWARN, but simply saying that anything that doesn't hurt anybody it's probably OK, is not necessarily the safest way to go. I'd rather hear it from the FCC than just assume it's legal, set up a network and relationships, and then be ordered to cease.

The prohibition on broadcasting has some exceptions.

> 1. The IARN (International Amateur Radio Network) -- interestingly, I have
> heard the people who run this, when interviewed on Radio Canada
> International's "SWL Digest" program, explicitly refer to their
> transmissions as "broadcasting"! The info they transmit is of interest
> to hams and non-hams alike, in many cases, and is not the urgent
> safety-related data cited before when discussing the "QST" situation.

The key word is network. When the transmissions are part of a roundtable
discussion between amateurs it is all right even if others are listening.

> 2. The code practice transmissions from W1AW (and I suppose there are
> other sources).

Code practice is specifically allowed by the rules. As a matter of
fact, I was tuning around 40 Meters one day and was intrigued to
find what seemed to be lines from Krishna literature. Sure enough
they were broadcasting "code practice" from California using their
books as text.

> 3. The RTTY transmissions of ARRL and CRRL bulletins.

Of interest to all radio amateurs, hence is legal for one way
transmission.

> facilitating business for either party to the QSO (either of you, so long as
> you are not in the pizza business or a professional eater). If you call
> direct, the business of one of the parties to the QSO would be facilitated.

It takes two to conduct business. If the business transaction between two
parties (and simply ORDERING the pizza is a verbal contract) takes place over
the telephone then it is ok. If the transaction takes place over the radio,
then it is not. Examine the situation and and see who are the parties in the
business. If they span a radio channel, call it illegal. If not, it might
be legal, but there is still the possibility that it is not on other grounds.

> The last time I read the rule, however, I got the feeling the the communication
> was prohibited if the business of ANYONE was facilitated. Depending on how you
> interpret, you could make a very strong case that both of the above are against
> the rules.

That is one possible interpretation, and if you are taken into court over it,
it might be the argument you face.

> Another problem area I have noticed is hams who have a radio or electronics

> shipment arrived today" meaning the piece you ordered arrived and you can
> pick it up. Other times it is much more obvious like "I have that in stock",
> or "If you are in the market for yxz, give me a call". Of course, all of these
> facilitate the guy's business, but he is very unlikely to receive a citation.

I believe this is an illegal practice.

> If someone points this out on the air one response is "well, I am not really
> making any money on the deal, anyway" which does not have anything to do with
> if you are conducting commercial affairs or not.

You are right, one does have to actually be making a profit to be conducting
business.

> As in the pizza case, one could argue these are only "technical violations" of
> the rules. There is no evil intention and no one is really being hurt. Then
> again, a "technical violation" is still a violation.

Right again, but there are possible arguments that someone is in fact being
hurt by it. My biggest concern is that all hams are being hurt.

The issue of the FCC rules against conducting business over the air is a totally separate issue from the issue of conducting business over a phone line classified by tariff structure as residential.

On residential phones, you can conduct personal business. You can order a pizza. You can make a verbal contract. You can ask for price.

I believe that what is legal over the air is a SUBSET of what is legal over a residential phone line. However, it might be the case that financial support of the autopatch by hams who use it might be considered to be enough business by phone company tariffs to classify the use as business, depending on the wording.

I've read the postings on ordering pizzas etc via ham radio with interest,
maybe i can add a european perspective.
Over this side of the water we dont have phone patch for a start, so the
majority of the problems dont arise. Similarly, we are not allowed to
transmit 'third party' messages except in special, pre-arranged circumstances,
so that again reduces the chances of such problems arising here. Strictly,
according to my reading of my license, it implies a requirement that if i am
talking to someone via ham radio, then that someone must also be a ham.
(OK my interpretation of my license may be wrong on that, but i play safe!).
There are special instances allowed for 'broadcasting' in the ham
bands - for example code practice and and news 'broadcasts' are issued
callsigns in the 'GB' series and are strictly not allowed to indulge in
two-way communication!
Hence, to get back to ordering food, if i use my 2M mobile to call someone
who is a ham, and suggest that they order a mushroom biriyani, then all is
fine. If i happen to be talking to someone else, and a non-licensed
person is listening (by pre-arrangement) for me to instruct said person to
go and order some food, then if i 'broadcast' to him/her, its naughty!
(since i am in communication with a non-licensed station and am not using
a 'GB' call!).

One question for the Statesiders - who pays for the call when you use
phone-patch via a repeater??? Sure could get costly if some nerd decides
to phone Sydney using a stolen rig!

>which was not likely, they'd alienate the Prez at a time when they needed
>his support on the 220 issue (and others), and if they opposed and lost,
>they'd have an enemy on the FCC for a long time.
>

I think the ARRL is showing rare good judgement here. The fact of the matter
is that whether or not Marshall is nominated, the fact that her name is
in consideration means that the influence channel is already there if in
fact there is one.

The 220 issue is a done deed. So it's quite unlikely we will have any
further encounter with with UPS. The ONLY thing we can do at this point
with an effort to block is make MORE enemies than we already have.

I'd suggest we forget this issue and redirect our energies to more
important things - like maybe making ordering a pizza on the
patch a felony. (no :-)

Message-ID: <8907150710.AA29827@ucbvax.Berkeley.EDU>
Source record: 18079

I was at the Indianapolis hamfest last weekend. One of the booths was operated by the NWS and the local Indy SKYWARN folks. SKYWARN sure seems to have all the support of the NWS. They even had a county map displayed with areas shaded in red to denote where "spotters were desperately needed..." Off-duty forecasters were there answering technical questions and meeting their spotters. Lots of good vibes.

The NWS and the local hams seem to have a good relationship up there. They did have that here as well, but I think the guy that went out to the NWS during storms is either a silent key or quit radio. I haven't heard him on the air for awhile.

Anyway, that's beside the point. The point is that the NWS is ALSO a government agency and, remember, they both belong to the Department of Commerce. NOAA is on the same level as the FCC (check me if i'm wrong). The last thing they are going to want to do is start an inter-agency fight over ham radio. I have a feeling that if the truth were known, the FCC and NOAA have a "gentleman's agreement" to leave the emergency stuff alone. Don't forget the DOD supports us also and they are a POWERFUL agency. We will always exist as long as we are part of the national defense contingencies.

We have more governmental backing than we think we do. I think this whole episode proves that. The fact that the guy wanted to stay out of it is not indicative of a lack of support, but rather I think he honestly didn't want to get in the middle. It's real easy to get hung out during a bureaucratic fight. My father retired from Civil Service and I know a lot about how a squabble like this can get someone crushed.

Chris, I hope you guys boot that wag out of your club. I really think that even if he did go to the FCC, he would get exactly the same neutral answer that you did. They are leaving it up to us to run it. Fine. Boot the guy out of the club. That's enforcement.

Anyway, i'll try to change the subject. What do you folks think a good hamfest is made up of? Should summer hamfests have SOME air conditioning? Let's talk about this. Indy was like the inside of a foundry. I went planning to stay all day and left in two hours. What makes a good hamfest (besides it being in Dayton the last week of April :-))?

Cross-posted to: sci.electronics,rec.ham-radio

I hope to buy a shortwave radio RSN, and have been unable to answer some questions in the course of my product research. So here goes! Any reasonably-informed answers to my questions will be greatly appreciated.

I would like to use it to listen to various news broadcasts, probably 1-2 hours per day. This would be at home, driving to/from school and at my desk at school (I will work on external antennas for all 3 locations). I think I would listen to the BBC and the Christian Science Monitor radio 30-50% of the time, but would probably listen to at least 1-2 foreign shows a day, from all over the globe. I do not need to get very weak stations, and I am not interested in collecting QSLs, but I would like to get a really good feel about what people (or at least governments) all around the world feel is newsworthy. For example, when an event occurs in the Middle East, I'd probably want to listen to Isreali, Egyptian, and Saudi Arabian broadcasts. And perhaps also Syrian, Iraqi, and Moroccan. I think this is all you need to know about how I hope to use the radio - let me know if I forgot something!

I realize that digital tuning is a must for reasonable reception of what I want to hear. I guess I could get a $40 cheapie portable and concentrate on the antennas, but I don't think this would give very good/drift-free reception (comments?). I originally hoped to spend about $100 (I'm a grad student), but it looks like $200 is the least I can hope to spend to get what I think I need. I've read in the World Radio TV Handbook and Passport to World Radio, and I've narrowed my choices to the Realistic DX-440 (aka Sangean ATS-803A; $210 all incl.) and the Sony ICF-2003 ($265). I'm leaning heavily towards the Realistic (I can even try it for 30 days and return it if I'm not pleased. I'd consider the Panasonic RF-B60 or RF-B65 since they have over 20 more memories, but I've heard they are not as good as the Sony). But I have a few questions/concerns:

- Drift. I hear the Sonys are excellent at preventing drift. Would the Realistic be good at this? I have no idea how much of a problem this is in everyday SWL.

- Memories. Is the 14 of the Realistic enough (like any resource, one can always use more)? I suspect I will have 1-3 stations I listen to daily, 2-5 more at least weekly, and 10-30 others at least monthly, all with 1-3 or more frequencies. But I don't really know what is a frill and what is really handy until I've had it for a while. And, of course, the Sony only has 10 memories.

- Other comments on my upcoming choice are welcome! Anything I've overlooked in terms of specs/features/problems?

- Someone posted a used ICF-2001 for $100 (it may be long gone by now). Would this be reasonable for my needs? I'd be inclined to pay extra for the Realistic, but it might be an option.

Again, thanks for any help!

(much text about pinhead problem deleted)

Chris,

You are playing into the hands of this pinhead by addressing him at all.
Use some psychology here. He's running his mouth to gain attention.
I'd suggest that you and your club simply and totally ignore him. Knock
him off the patch (without comment) when he violates one of your club's
rules but otherwise, totally ignore him.

Regarding the FCC, leave them alone. In the event this pinhead DOES
file a complaint, they will most likely ignore him (al la New York cabbies).
If they do anything, it will likely be a letter asking for your side.
At MOST on an issue as ambiguous as this, they will tell you to stop until
they make a decision. Only THEN would I worry about the FCC.

Meanwhile, enjoy yourselves and ignore him.

John

Actually, the telephone companies are violating the sinecure of the
telegraph companies, who are violating the sinecure of the post office,
who violated the sinecure of the messenger services.

None of which mean beans.

All telecommunications in the USA is nominally open to competition. The
cellular companies do NOT have a right to your business, nor do telcos,
even if they happen to be the pay-phone providers (and sometimes,
thieves are instead). Please stop spreading stupid rumors like the one
above!

BTW, wrt Paul Flaherty's comment, autopatching was entirely unaffected
by the 1/1/84 changes in the telecom industry, for similar reasons.

I've got the Sony 2010, and I really like it. The only weak spot is the
speaker, which is tinny. I still haven't found a decent solution for that,
but it also doesn't bother me except for really noisy signals. Otherwise,
this is a really hot portable. The Sangean is also well thought of and
somewhat cheaper, I believe.

Message-ID: <0616427421@uwovax.uwo.ca>
Source record: 18085

Has anyone figured out any of the keypad sequences to do out-of-band mods for the new Yaesu dual band? What about a repeater mod?

I have performed the VHF out of band mod and it expands receive coverage to 130 to 180 but would like VHF transmit and UHF transmit/receive. (I know the type approved rule so no flames please).

It is a great little radio and would recommend it highly, however it is more susceptable to intermod than my 727.

Thanks for any info.

Hi, somewhere I remember reading that the 75 has the same controller
as the tm-721 dual band mobile. If this is the cas then the same
modes would apply. Do you have the 721 mods? If so a quick look inside
should do the trick to verify if the mods apply to that controller as
well. If you need the 721 mods (for xband) I can send you a copy of the
official bulletin, but I somehow suspect that there are a few (lots here)
of modified 721s around (including out of band rx/tx). good luck.

>Once apon a time, there was an elite country club. For years it has
>entertained its members, and the town pretty much left them alone as long as

[Lots of stuff deleted...]

The private country club where I am a member decided to go semi-private.
In addition to the members (who had paid $10,000 to join the club), anyone
could use the golf course for an $18 green fee.

The course rules were posted on a large sign at the entrance to the pro
shop, the back of the score cards, and at numerous places around the course.
The course, which had always been well maintained, started to go to pot.
None of the new users bothered to fix ball marks or replace divots. They
drove their carts anywhere they felt like, gouging deep ruts in the
fairways. Cigarette butts and beer cans were everywhere. Members who
politely asked offenders to clean up their acts were threatened.

These abuses were finally stopped when the club reverted back to private
membership only. If I had to decide between shutting the club down or let
the non-members back on the course, I'd rather see it shut down...

How does this relate to ham radio? Simple. It's human nature that people
don't respect that which is unearned. The 5 WPM code requirement is so
trivial that any arguements against it being retained as a license
requirement just don't hold water. The so-called barriers people have with
respect to the code are psychological--they don't even give themselves a
chance before they've convinced themselves they can't learn it.

Using a similar arguement to the one used by the "no-coders", why don't we
delete most of the theory exam as well? One doesn't need to know Ohm's Law
to go down to Ham Radio Outlet, buy a radio and antenna, and use it on the
air, do they? Of course they don't, so why should they be forced to learn
something they will probably never use?

I just don't understand the attitude of people who think ham radio's salvation
lies in hordes of ignorant operators who care little about the institution
invading the bands.

>Ordering a pizza is a CONTRACT. Legally speaking, that's BUSINESS.

Please inform us as to where you got your law degree and cite
cases to substanciate you otherwise worthless (armchair) opinion.

>Since when is Ham Radio a personal communications system?

Since when is it otherwise? What do YOU use it for? Actually
I don't care what YOU use it for.

>--Phil howard-- <phil@ux1.cso.uiuc.edu>

>This is certainly getting closer to the "hairy edge". If you called for
>general information from local hams (who hopefully had the schedule) instead
>of patching to the bus company, then I would say it would be ok. If it were
>through my repeater, I would not even think of dumping the machine. On the
>other hand, patching to the bus company might make me think about it, but I
>probably still would not. If you started asking what the bus fare was
>(which you could have done when the bus arrives) I might do something.

Geez, I really get sick of all the hams giving each other a hard time.
This guy Phil (Howard) keeps on talking about how he would dump people off his
autopatch for making calls to order pizza,etc. Well, If I was the
local coordinator, his repeater would quickly become UNcoordinated and
the frequency reassigned to someone who will put up a repeater/patch
and NOT try to run the think like HE'S god and then he can do damn well
as he please with HIS repeater as long as he doesn't interfere with real
COORDINATED repeaters!!!

>There is a common carrier that is losing revenue, the cellular telephone
>providers.

Wrong here. The cellular telephone provide can't be loosing revenue unless
a person has BOTH a cellular phone AND a ham radio in his car and he
CHOOSES to use the autopatch to save money. If he doesn't have a cellular
phone, then there's no way in hell the cellular company had a chance to make
any money off of him in the first place. Sorry, you reasoning isn't just
flawed, it's WRONG.

Phil Karn says
>The rule that simply says "thou shalt not make money through amateur radio
>communications" is enough for me. Human nature being what it is, very few

I couldn't agree more and by ordering a pizza via autopatch and on the
way home, I'm not making a bleeding cent so please stop trying to be
some god given airwave policeman. Of course, I tend to agree with most if not
all of Phil's postings.

To Phil Karn:

(d) The following one-way amateur transmissions are not considered broadcasting:

(1) Beacon or radio control operation
(2) Information bulletins consisting solely of subject matter relating to amateur radio;

Perhaps you could include some information on the SKYWARN nets meant solely for amateurs like - better crank those towers in county XYZ down, since there's a thunderstorm headed your way, etc. Aim the information AT amateurs so you can specifially justify it. In this way it would meet the criterion
(2) listing above and copied from a posting by Andrew Betz @ OSU.

Just a general observation on the part of a fairly new member of the ham ranks:

In light of the recent spectrum grabbing by the FCC on 220-222 MHz, and reports of business interests infiltrating the FCC, methinks it would be a mighty good idea, indeed, to err on the side of caution. All the FCC needs is another excuse to grab more spectrum away from hams "abusing the privilege" and sell it to business interests.

If erring on the side of caution means not using the autopatch for ordering pizza, then so be it. After all, non-commercial only use of the autopatch is better than total *non-use* of the autopatch, which could happen if the FCC decides we have been misusing the privilege.

That is not to say that we shouldn't ask for a more clear definition of the "pecuniary interest" exclusion. Yes, it is vague wording and needs clarification. However, until that clarification is made, we should continue to play it safe so that the FCC has NO opportunity to point at violations, even if they are "technicalities" or "in the spirit of the law."

As for this being a "wimpy" stand, as some have suggested: I'd rather be a wimp and operate legally and try to preserve our remaining spectrum, than be a rebel, ruffle a few feathers, and maybe end up screwing up the spectrum for everyone, including those who choose restraint.

The bottom line is, when in doubt, CYA.

Oh boy, you're gonna get a lot of interpretations on this one....

The story I read explained that in the early days of amateur radio, the
professional radiotelegraph operators claimed that the amateur radio
CW operators were "ham-fisted". That is, they didn't send very well.

> I am surprised that the ham swaps can exist since they are a "business
> transaction for profit" on the air.
>
> What is the difference between them and the infamous "pizza transaction"?

There is a difference. The on-air swaps are considered to be announcements of the availability of items related to the amateur service, even though it would be necessary to conduct business to exchange them. Even the base asking price can be announced. However, the ACTUAL business of haggling the price and making the CONTRACT cannot be conducted on the air.

The transaction "I'd like to order a 12 inch Deluxe, no anchovies, to be delivered to..." is the same as "I'll buy your TS-520 for your asking price if you deliver to my home before the contest this weekend".

> After a long period of inactivity with ham radio, I was very suprised to
> hear that they could be conducted legally over the air.

It depends on what you think it is. It isn't business to me.

1569. HRO say "no" to No-Code; BAH-HAMBUG

Newsgroup: rec.ham-radio
Date: 1989-07-14 23:07:42 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500060@ux1.cso.uiuc.edu>
Source record: 18093

I just heard from Westlink Report that the management of Ham Radio Outlet wrote to the ARRL Board of Directors recommending that they back away from the No-Code proposal. The quoted reasoning is that Amateur Radio "has already matured" and "No-Code does not represent the needs of the current ARRL membership".

While I have never yet made a purchase from HRO, barring a denial or reversal by the management, I certainly NEVER WILL purchase ANYTHING Ham Radio Outlet. ----- ---- --------

The line of reasoning used is so utterly stupid as to be almost insulting to the fact that I even hold a ham radio license. They are obviously ignorant of the fact that the very purpose of the No-Code proposal is to expand the bounds of what Amateur Radio is to include a group of people who have heretofor been excluded from using VHF and UHF radio frequencies by a bunch of Morse Code bigots who predominantly use HF frequencies. It does not matter what the current ARRL membership is, if it remains limited to that membership then Amateur Radio is doomed.

If the No-Code proposal never makes it through this time around, then there will be proposals to create a whole new service for competently licensed emergency and experimental communications. The proposal will transfer Amateur Radio frequencies above 30 Mhz to this new service.

Now wouldn't it be much better if these two areas were working together instead of locking horns in battle? There are obviously two camps in this issue, but one of them clearly wants to force their way of radio onto the other and keep them restricted in numbers.

I have heard that HRO is selling radio transmitters to non-licensed persons, and that many of these radios are functional from 11 meters through 10 meters. If this is the case, then it is obvious to me that HRO would stand to actually PROFIT from the destruction of the Amateur Radio Service. I did call them once to find out if they would limit says of radio transmitters for Amateur frequencies to licensed amateurs, but they said they don't verify licenses. I did NOT ask about buying an out-band radio, so I don't know for sure what they are really doing.

If the ARRL does not adopt and push the No-Code license proposal, either the one suggested by their committee, or any other reasonable one, then I will NOT be renewing my membership come this September.

1570. Anyone monitoring the taxis?

Newsgroup: rec.ham-radio
Date: 1989-07-14 23:07:45 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500062@ux1.cso.uiuc.edu>
Source record: 18094

Can someone who is monitoring the illegal taxi transmission on 10 meters in New York post some information about what transmissions are taking place?

Things that would be nice to know are:

1. What frequencies are in common use.
2. What times of the day are most heavily used.
3. How much air time they are actually using.
4. The technical quality (or lack thereof) in their signals.
5. How well is their signal propogating over the country.

--Phil howard-- <phil@ux1.cso.uiuc.edu>

1571. FCC response to taxi invasion

Newsgroup: rec.ham-radio
Date: 1989-07-14 23:07:47 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500063@ux1.cso.uiuc.edu>
Source record: 18095

I heard from Westlink Report that a response the FCC has given concerning the illegal taxi transmissions on the Amateur 10 meter band is "it's a low priority thing".

1. I am beginning to suspect that the FCC is not considering the protection of ham radio frequencies as high as a form of punishment for pursuing the matter over 220-222 Mhz through Congress.

2. If someone were to transmit over, and fully interfere with, the illegal taxi transmissions, that the FCC would probably not be very quick to get involved in the matter unless someone was so stupid as to sign with their real call.

<<Ordering a pizza is a CONTRACT. Legally speaking, that's BUSINESS.>>

<heinzl_c@apollo.COM (Carl Heinzl)>
<Please inform us as to where you got your law degree and cite cases to substanciate you otherwise worthless (armchair) opinion.>

A contract is, in general, an agreement between two parties to supply goods and/or services in return for consideration received. When you call to order a pizza, it is not a contract unless it is voluntary, between parties of legal capacity, for lawful purpose, and involves an offer and acceptance.

"I'll have a small anchovy supreme extra with extra mushrooms."
"That'll be $8.50, 15 minutes."
"Okay, see you then."

...this is an *implied contract*, in that there is no written agreement. If you did not pick up the pizza, and were honest enough to agree to the conversation, the merchant could sue for breach of contract, although such action for such amounts is rare.

As a legally enforcable implied contract, using the autopatch in this case is certainly business use. Whether it should be tolerated as "barely wrong", or whether the current rules should be changed was obviously not the concern of the previous poster, nor this reply.

Sorry to be so long-winded, but people who are rude irritate me, especially when they are wrong. I hope Mr. Heinzl obtains a civility degree before making another such posting.

I do not have a law degree, but I have owned and operated several businesses, read extensively on business law, and written contracts that have held up in court.

SpaceNews

MONDAY JULY 17, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* UoSAT D and E *

Last week, things were very hectic for the UoSAT Spacecraft Engineering Unit, as a complete engineering model of the UoSAT D+E spacecraft has been put together: the structure with boom motor plus engineering module-boards in the module-boxes. Engineers spent many hours into the early morning assembling the satellite, in order to get it ready for the vibration test, which commenced on Wednesday, 12th of July at the Royal Aerospace Establishment (RAE) at Farnborough, England.

The spacecraft is now going through qualification vibration tests at 14g rms. By Thursday night the Z Axis sine and random tests were completed and currently the 1000 G shock tests are being performed. After these have been completed, the tests are repeated in the X and Y spacecraft axes. UoSAT Director, Dr Sweeting (G3YJO), reported that the sound produced by the vibrator machine is louder than that of an underground metro train passing by in a narrow station. The violent vibration does not seem to do the spacecraft much harm. Apart from a few bolts which worked loose, the structure is strong and it will withstand the 'shake' experienced at launch without difficulty. UoSATs D and E, which after launch and separation from the launcher will probably become UoSAT-OSCAR 14 and 15, both have the same mechanical structure, weight and dimensions. They will be the first microsatellites separated from the ASAP - followed by the four Microsats, which from then on will be known as OSCARs 16, 17, 18 and 19. The current launch date is the 10th of November - with a 10 minute launch window around 0200 UTC. Fingers crossed!

[Story via OSCAR-11]

* RS12/RS13 NEWS *

Vern Riportella, WA2LQQ, recently paid a visit to the RS command station in Moscow, and found the new RS12/RS13 package ready to fly, but grounded. The transponders were already placed into satellite package back in late 1988,

but the launch depends on the demand of the maritime navigation system package which is the primary payload for this launch.

The RS12/RS13 launch will probably occur sometime next year.

* OSCAR-9 NEWS *

The current operating schedule for OSCAR-9 indicates that Diary software reloads will take place on Tuesdays, UTC. Digitalker telemetry will follow. The telemetry channels currently being downlinked by the Digitalker include:

08 : Battery Pack A Temperature (C)
18 : Battery Pack B Temperature (C)
22 : Battery Voltage +14V (Volts)
29 : Spacecraft -Y Facet Temperature (C)
35 : 145 MHz Beacon Output Power (UnCalibrateD)
39 : Spacecraft +Y Facet Temperature (C)
49 : Spacecraft +Z Facet Temperature (C)
59 : Spacecraft -Z Facet Temperature (C)

Note that the telemetry value for channel 35 is UnCalibrateD (UCD). In order to decode the proper value for this channel, substitute the "N" value given by the spacecraft into the equation : (N-82) * 1.67. The result is given in milliwatts.

* UO-9 elements from RGO *

* OSCAR-10 SCHEDULE *
---
14 July-Sept : Mode B operations are allowed for the entire orbit.

* OSCAR-11 NEWS *

The 2-meter beacon turns off for 10 seconds following the DCE message titles.

Here is the present Whole Orbit Data (WOD) survey schedule for this week:

Day	Channels
Sun	2,61
Mon	1,2,3,61
Tue	53
Wed	19

Thu 1,2,3,61
Fri 0,10,20,30
Sat 10,11,19,29

* OSCAR-12 SCHEDULE *

Date Mode Operating Period

15 Jul JA 1113 - 1925
19 Jul JD 0939 - 1751
22 Jul JD 1508 - 0804 (23 Jul)

* OSCAR-13 SCHEDULE *

Date : 14Jun89 until 16Aug89 | 16Aug89 until 16Nov89
Attitude: 180/0 | 210/0
Mode-B : MA 000 to MA 110 | MA 003 to MA 160
Mode-JL : MA 110 to MA 145 | MA 160 to MA 200
Mode-B : MA 145 to MA 255 | MA 200 to MA 240
OFF : % | MA 240 to MA 003
Mode-S : MA 150 to MA 160 | MA 210 to MA 222

Mode-B ZRO Receiver Sensitivity Test Schedule:

Sun 16Jul89 07:20 UTC
Sat 22Jul89 20:50 UTC
Sat 29Jul89 04:20 UTC
Sat 12Aug89 20:20 UTC

A downlink frequency of 145.840 MHz will be used for these tests.

Transponders will be in operation during the whole orbit from June 14 until Aug 16 due to excellent sun angle and power budget. There will no perigee operation between August and November due to perigee solar eclipses.

I believe there is a formal memorandum of understanding between the ARRL and NWS regarding SKYWARN nets, and this memorandum was signed within the past year or so in order to clear up the kind of misunderstanding you're plagued with.

If I recall, the QST blurb announcing the formal agreement also said that the FCC blessed the arrangement, subject to the caveat that NWS should carefully evaluate their ongoing communications requirements, and, if necessary, seek specific allocations from NTIA in order to carry them out.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Hi all,
I'd appreciate it if someone would give me some info on 2 meter operation
in northern Calif. (SF area, Yosemete Nat'l etc.).
I'll be taking a vacation there during the second half of August and,
of course, will be taking a 2-meter rig.
Unfortunatel, Packet won't be operated on this trip, as I haven't a
portable computer, oh well (sigh).
thanks, Joe Skoler, KC2YU, skohc@cunyvm

I have posted in this forum in the past concerning my tribulations with HRO. My comments are based on my experience with the store in Atlanta. I have found these clowns to be arrogant, disrespful, ignorant of the practices of ham radio and just a very nasty bunch. Offenses have ranged from making me wait over 30 minutes in an empty store while both salesmen chat with friends on the phone to sending me a letter when I was newsletter editor of The GrapeVine (GRAPES) in which the store manager questioned my request in the newsletter for area hams to support GRAPES' network building activities. His position was "if GRAPES does not build digipeaters, someone will and I'll use whatever's available". This attitude would be bad enough from a private individual but comming from a store that depends on the goodwill of the amateur community is astounding.

I'd echo Phil's comments to completely and totally boycott these clowns. I personally will never set foot in another HRO store nor do business with same. (I've spent about 3000 bux on ham gear since I made that committment.) There are a number of other VERY good equipment outlets available so let's use them.

Phil, why do you keep inflicting these flawed attempts at analogies on us?

The country club analogy misses the anti-no-coders' point: there _is_ something more required of a ham than just the ability to push a PTT switch and yak. It is a drive, a desire, a willingness to earn privileges, not to have them handed to oneself on a silver platter. Your fable misses the point again.

Someone who doesn't want to be a ham badly enough to fulfill the requirements of obatining a license doesn't deserve to be one.

Pat, you and Jerry are taking my posting too seriously. It was meant to be a cynical response to a real problem. The problem is that a fraction of our society is hell bent on telling us what our rights are, or the correct way to live. They demonstrate and and encircle congressmen who then sway to their cause. Life is hell until someones battle reaches the Supreme Court where constitutional and republican spirit are measured. They generally side with all peoples rights, rather than the select few who wish to impose their restriction on this or that. I don't see anyone demonstrating for the aged or the mental cases walking the streets, but we have society in a roar over the contents of the womb. Religious persecution is another story however. When the state or congress makes a law to restrict your rights, you generally get pissed. When the state or congress supports your cause, you are enthralled and so happy that you look for another cause. Policemen deal with crime all day. They don't have time to decide what's a big crime, what's a little crime. It's a law, therefore you are under arrest. "I'll take that radio, thankyou". You don't like it? Get a lawyer! Rather than investing in speech encryption for a cellular phone, they (through their PAC) get congress to make owning a radio (capable of listening in) illegal. Congress thinking ahead then keeps adding to it. After awhile all your left with is the commercial AM and FM bands being legal. Those Amateurs shouldn't have more rights then the others! Take their radios too! I realize that this sounds like their coming to get me, but I'm impressed at the speed at which we're going towards implementing restrictive laws. Virginia was/is the best case: they confiscated radar detectors and scanners. These radio devices are "State" contraband. You can even take this all the way to the "No-Code" debate. Some have recently compared our Amateur rights to a country club. The Amateur rights are given to us by the people! When we encircle our congressmen and send hate mail to the FCC and demand that we keep our restrictive laws, we're no better than those who are doing the same thing by banning radios. Amateurs used to be self supporting. They produced more than they took. The FCC never had a real problem with them. Now their old and tired. Most can't even drive anymore. So they sit and call, write letters, hire lawyers. What a waste. I'm sure the FCC would rather just chuck it all. When a company comes to them with an idea that requires spectrum, they probably couldn't be happier to give it to them. After all their "The People" too. (pardon any spelling infractions), Steve.

I don't have to have a law degree to understand law and make an interpretation
for my own purposes. I wish more people did understand what law was.

Maybe this whole thread should all be moved over to misc.legal where the
number of people who understand law is higher than the number of lawyers.

> >Since when is Ham Radio a personal communications system?
>
> Since when is it otherwise? What do YOU use it for? Actually
> I don't care what YOU use it for.

CB is a personal communications system. GMRS is partly so and the FCC is
trying to get the business uses out of it. But, ham radio is an
experimental and emergency communications system/service.

> and NOT try to run the think like HE'S god and then he can do damn well
> as he please with HIS repeater as long as he doesn't interfere with real
> COORDINATED repeaters!!!

One does not have to be GOD to read the rules and try to realize what is
legal and what is not. Granted, not everyone is going to come to the same
conclusion as everyone else as to what the rules mean. But one thing I am
very sure of is that the repeater operator is just as liable for the traffic
going over his repeater as are the hams using it, if not more so. If someone
is doing what I believe to be illegal on the repeater, then MY butt is the
one in the sling, and I am going to protect it.

When I operate a repeater, it is MY interpretation of the rules that will apply to its operation, NOT Carl Heinzl's or the repeater coordinator's.

Repeater coordinators who think they are GOD will also be degrading to the Amateur Radio Service as well. Why do you think there are coordinator wars as it is? Coordinating frequencies is NOT the process of some self-appointed group of godheads thinking they can run roughshod of a whole state of repeaters.

> flawed, it's WRONG.

By having chose not to get cellular telephone in the first place, just because you can use your Ham radio, GMRS, or CB to avoid the charges, not only the air time charges, but also the basic service charges, then they are in fact not gaining a profit. The question is really whether or not they have a proper basis to assume that they should have that profit. This is arguable, but the fact that by not paying them for a service they don't get a profit is not.

> Phil Karn says

> all of Phil's postings.

While I personally would just as soon have the rules read in such a way that ordering a pizza is legal, I happen to find that each time I read my copy of 47 CFR 97 I find that they are not. I also read the Federal Register and to date have not read an NPRM nor any mention of a petition being filed to change the rules. Why don't you file a petition to make the change? I'm busy trying to get some data to support my petition for a No-Code license. I also don't want the FCC to classify me as someone who files too many petitions.

> To Phil Karn:

> (2) listing above and copied from a posting by Andrew Betz @ OSU.

While this seems reasonable enough to do, I also happen to believe that since the messages in an active net are already directed to the members of the net who have checked in, that it does not even fall under one-way broadcasting because it is already a two-way communication.

NJ6A writes:

>If I had to decide between shutting the club down or let
>the non-members back on the course, I'd rather see it shut down...

This attitude was once known as a "scorched earth" policy. After that it
also became known as the "better dead than Red" policy. Not everyone would
make the same choice.

>How does this relate to ham radio? Simple. It's human nature that people
>don't respect that which is unearned. The 5 WPM code requirement is so

>chance before they've convinced themselves they can't learn it.

There's an interesting contradiction here. You say people need to earn their
privileges, but then you say that 5 WPM is "trivial". So getting rid of the
requirement shouldn't make much difference, should it?

The code requirement is NOT trivial. It took me several months of solid
practice to make 5 WPM. This was early during high school, when I had lots
of spare time. I've often wondered if I ever would have become a ham if I
hadn't done it when I did.

>Using a similar arguement to the one used by the "no-coders", why don't we
>delete most of the theory exam as well? One doesn't need to know Ohm's Law
>to go down to Ham Radio Outlet, buy a radio and antenna, and use it on the
>air, do they? Of course they don't, so why should they be forced to learn
>something they will probably never use?

You're quite right; you don't need to know Ohm's Law to operate a radio.
Many other radio services have shown this quite well. But merely being able
to operate a radio doesn't necessarily mean you can further the basis and
purpose of the amateur service. Three of the five principles listed in part
97.1 require technical knowledge, hence a technical test. On the other
hand, an amateur can easily fufill all five without ever using or even
knowing Morse Code.

>I just don't understand the attitude of people who think ham radio's salvation
>lies in hordes of ignorant operators who care little about the institution
>invading the bands.

This is known as "setting up a straw man". The no-code license proposed by
the ARRL Study Committee would still require an applicant to pass elements 2
(Novice) and 3A (Technician). In fact, the syllabus for element 3A is under
revision and the Committee recommended that it be expanded. This means that

those "hordes of ignorant operators" will have passed a written test equal to or greater than that already passed by existing Technicians. The only thing to set them apart will be their lack of knowledge of the code, and this is something I find hard to detect in a voice or packet QSO.

You seem to judge hams by the tests they had to pass to get their licenses. I prefer to judge them by what they *do* with their licenses after they get them.

Phil Karn, KA9Q

copied from packet:
From: KD2EJ@N2EYR
To: ALL@ALLUSA
Subject: TS-440S DISPLAY SOLUTION

I finally took the time to inspect carefully the problem on the TS-440S display problem. The first thing was to check the EPROM socket on the display board. I found that the socket was not in good shape. The IC was very loose and the socket is of very poor quality. I removed the socket from the board with a solder sucker, making sure that none of the wires connected to the display board was damaged or pulled out.

You have to remove the 4 screws that hold the board to the front panel, so that the board is free and can swing open so you can have access to the other side. After this is accomplished, the rest is easy. Even though Kenwood says to remove the socket and solder the eprom right to the board. I chose not to solder the chip to the board. I decided to replace the socket with one bought at Radio Shack for 0.89 cents. This particular socket has the connections right on the surface, so that when you place the Eprom on it, you can see that good contact is being made on each leg of the chip. The socket is called a low profile socket.

I soldered the socket to the board and replaced the eprom. I carefully placed all the wires were they belonged and replaced the metal cover over the display board. When everything was back in place I turned the rig on holding down the (A=B) indicator and did a reset. The freq display showed 14.000 mhz. The display is working fine so far, and all seems to be back to normal. I would not try this operation unless you have the right tools to desolder the socket, and a worktable with proper lighting. There are lots of wires to worry about. Be careful.. It beats sending it back to Kenwood. Kd2ej ..... Winston ....

1588. S-Band Beacon on Moon

Newsgroup: rec.ham-radio
Date: 1989-07-17 14:42:11 UTC
From: wjc@XN.LL.MIT.EDU
Message-ID: <1473@xn.LL.MIT.EDU>
Source record: 18117
Cross-posted to: sci.space,rec.ham-radio

In the last year or so, I read about a radio transmitter that was left on the Moon by one of the Apollo missions and that is still operating. Its frequency is somewhere around 2.3 GHz and is used as "beacon of opportunity" by some radio amateurs who conduct moonbounce operations on the amateur 13-cm band.

Does anyone know which mission left this transmitter?

What is its location?

What was its purpose? I assume it was for telemetry of data from some experiment package. If so, is the package still supplying data?

What is the transmitter's power source?

What are its frequency, modulation type, output power, antenna gain, and polarization?

Are there any other operating transmitters on or orbiting the Moon?

If you think about it, reception of this transmitter's signal is probably the closest thing to proof that man has indeed put objects on the Moon -- at least that is available today to those of us outside the space-program complex.

Thanks,
Bill Chiarchiaro

I may have asked this already, but now is a good time to repeat
it.....

I live in Eastern Bergen County, NJ. Is there a local SKYWARN net
during severe storms operating in this area that I could monitor, on
either 2m or 440?

Thanks.
Mark

Source record: 18111

In the general spirit of HRO bashing, the behavior of a couple of employees of their Oakland store, then on Telegraph Avenue, was responsible for my putting off getting back into ham radio for a couple of years. I had a novice license 20 years ago, and had always kept a small amount of contact with the field, so soon after I moved to Oakland, I stopped into the store there to talk and look around, and the two people there were so unfriendly, rude, sexist and racist, that I decided that this was a group of people I wanted nothing to do with.

It was only through the Info-hams/net.ham-radio connection that I decided that there was something for me here after all.
Thanx, people.

Hmm... Looking at 75 meters and the local 2m repeaters, there aren't
any other skills being exhibited :-}.

> It is a drive, a desire, a willingness to earn
> privileges, not to have them handed to oneself on a silver platter. Your

This is the typical works-righteousness approach that the no-coders all
spew. To be an effective ham (eg., participate in disaster relief,
technically experiment, pass traffic in a net, investigate UHF
propagation, ...), one needs to develop on-the-air and in-the-workshop
skills. Yes, DEVELOP them. These shouldn't be prerequisites for
membership in the club, but should be skills that are picked up AFTER
one is working with more experienced hams [in fact, I would argue that
it is very difficult to develop these skills without such close contact
with gurus]. The present code and theory tests do nothing but prevent
apprentices access to these experienced hams.

> fable misses the point again.
>
> Someone who doesn't want to be a ham badly enough to fulfill the
> requirements of obatining a license doesn't deserve to be one.

But do the present requirements adequately reflect the prerequisites
NECESSARY for one to be a successful ham? Code tapes and theory books
do not automagically turn a lid into Mr./Ms. Perfect Ham. It may be
that most people do not have difficulty with 5 wpm code, ONCE THEY
DEDICATE THEMSELVES TO LEARNING IT, but if a would-be ham believes that
it is difficult, that may prevent a technically-competent and
operationally-courteous person from joining our ranks. It took me 15
years after I originally thought about becoming a ham to finally do it,
simply because of this psychological barrier. I don't think I'm a
better person for simply having gotten around to learning code...

John,
Let's not roll over and play dead quite yet. We still have a whole series
of legal maneuvers to go through. The FCC see this as a "winner take all"
issue with the future of all frequency allocation ppower at stake. We should
consider it as such as well. If we loose then the FCC will have successfully
pushed us back into some little corner and will most probably rain havoc on
the rest of our allocations. After all, "how dare those hams question our
authority to do whatever we want". If we win then at least the FCC will
have to prepare a stronger case when they want spectrum. And maybe if they
don't have a strong case they won't try anything knowing that they are up
for a fight. Support the fight for 220. The hobby you save may be your own.

1596. How to clean-up dirty PLL synth output?

Newsgroup: rec.ham-radio
Date: 1989-07-17 17:06:10 UTC
From: mjj@stda.jhuapl.edu
Message-ID: <2065@aplcen.apl.jhu.edu>
Source record: 18114
Cross-posted to: sci.electronics,rec.ham-radio

I've been trying to employ the Motorola 145151-1 PLL synthesizer chip
to make a bunch of synthesizers, which I plan to use instead of crystals
because of the crystals' cost and long shipping leadtime. I am finding
that it is easy to build a synth, but hard to build a clean one.

The circuit I'm using has a 9.102222 MHz reference oscillator divided
by 8192 to give 1.111 kHz. The VCO operates at around 15 MHz, which
when multiplied by 9 provides the receiver LO for the 2-meter band.
Besides the usual reference signal sidebands at +/- 1.111 kHz, I am
also seeing some about 66 kHz away. This sure ain't phase noise (is it)?

Is there anybody out there with pointers on how to design them for
clean operation? Remember, if you reply on the net, please limit
the newsgroup above to the one in which you saw this. Thanks,
Marshall Jose WA3VPZ

If you were the local coordinator, and pulled a shenanigan like that in
Texas, you wouldn't be the local coordinator any more. Remember how
coordinators can't make value judgments? That is about the biggest one
that can be made, and is NOT the way to make coordination decisions.

Please, people, remember that coordinators aren't tyrants trying to
force amateur radio into their own mold.

>If someone
>is doing what I believe to be illegal on the repeater, then MY butt is the
>one in the sling, and I am going to protect it.
>When I operate a repeater, it is MY interpretation of the rules that will
>apply to its operation, NOT Carl Heinzl's or the repeater coordinator's.

This is exactly the way it should be. The repeater trustee will (and
has, in several cases) be held responsible by the FCC for transmissions
on that repeater. He has the right to operate it in such a manner as he
chooses, and will be held responsible for the choices he makes.

>Repeater coordinators who think they are GOD will also be degrading to the
>Amateur Radio Service as well. Why do you think there are coordinator wars
>as it is? Coordinating frequencies is NOT the process of some self-appointed
>group of godheads thinking they can run roughshod of a whole state of
>repeaters.

...and any coordinator who thinks differently gets trampled himself.

Coordinators are just people trying to do what's necessary to keep the
bands from being filled with warring repeaters. To a very great extent,
they've succeeded, in large part because they don't try to regulate how
repeaters are to be run. If a coordinated trustee chooses to run his
repeater in a manner contrary to the rules, that's his problem, not
ours.

> battery pack?

Option 1: What you need to buy is the "adapter". You take off the
battery, slide on the adapter and plug it into the cigarette lighter.
What I did was to buy the "battery separater" cable from ICOM and cut
the cable and install a cigarette plug on it.

Option 2: Buy a "Docking Booster" from WSE in Florida. Your 2GAT
slides on to it and now puts out 25-30 watts.

> Another related question for the net. Icom failed to mention what the

> are: Capacity- 270mAh/13.2V Average Operation Time- 1.5 hours.
> Does anyone on the net recommend a longer lasting/better battery pack
> for the IC-2GAT?

Yup, you discovered it! Its the BP-70... the 7 watt, 7 minute pack!

The BP-8 is 825mAh, a BP-8S is 1200mAh, but the voltage is about 9.6V.
The 8S is available from a 3rd party (look in 73).

It won't work to recharge the battery while you are using it, because
the ICOM charging scheme splits the pack into 2 groups of cells and
charges each of them seperately. If you attempt to run the radio at the
same time, 1/2 of the cells get the full charge and what should have
charged the other 1/2 is instead used to power the radio (at 1/2 the
voltage).

The 02AT has a power jack on the top of the radio, so you could run it as a mobile without a battery.

SIGH
Here we go again.....

But what the anti-no-coders are EFFECTIVELY saying is that everyone who is to get a ham radio license is to have such an overwhelming desire and willingness to be a ham that they will be willing to do unusual things such as the following:

1. Sit on a flagpole for 5 days.
2. Eat 5 bugs (the creepie crawly kind).
3. Learn Morse Code at a rate of 5 WPM.

Now number 3 happens to be applicable, and important to learn, for hams who are interested in communicating internationally using CW. It might even be applicable for any use of the HF bands, although there is more debate in that. Number 1 and 2 are just as inapplicable to ham radio as 3 is to 99% of VHF/UHF work. Would YOU be a ham today if numbers 1 or 2 were required? Oh, you might if you were intensely dedicated, but vast numbers of people would not be just because the requirement is not applicable.

If Phil missed a point (and I am sure that if he did, it was a typo) then that point is that learning Morse Code has REALLY NOTHING TO DO WITH the kind of operation expected of the vast majority of new licensees that proposals such as the one the ARRL committee recommand or the ones discussed on the HAMLICEN mailing list.

What anti-no-coders want to do is to perpetuate a requirement that WAS ONCE APPLICABLE to the vast majority of what hams used to do, and is TODAY *NOT* at all applicable to the vast majority of what goes on above 50 Mhz, and continue to HAZE incoming hams by requiring them to go through the same process they had to go through when they go their ham radio license.

To people who are interested in HF CW operation (and there are and will continue to be many of them coming into ham radio), learning Morse Code certainly seems to be interesting, and they will put in what little work they probably actually need to do to learn it, even if it were not required. Thus the requirement only serves to make the entrance harder for those who are not interested in it.

There was a time when 13 WPM was required to get a ham radio license. Probably most ham radio operators used Morse Code at that time. It was

NOT a filter to keep out the riff-raff, it was applicable and it made sense. Today it does NOT make sense for all hams, and so the anti-no-coders have taken to the new low of saying that it is necessary to ensure that whoever "gets in" has an intense desire to do so by studying an unimportant (to their interests) subject. Some have even used the argument that the code test helps keep out the "CB riff-raff"; I recall the code test predated the CB service.

> Someone who doesn't want to be a ham badly enough to fulfill the
> requirements of obatining a license doesn't deserve to be one.

I agree to the words, but to YOUR implied meaning. I want the requirements to be applicable and pertinent to the kind of skills and competency that hams need to have to operate the aspects of ham radio they are interested in.

Now tell me, Jay, are you thinking that all would-be hams are only interested in working CW on the HF bands, or are you thinking that whatever else anyone is interested in, they certainly will be working CW on the HF bands as well?

SUMMARY:

1. Is a Morse Code practical exam relevant to what a significant portion of Amateur Radio has become today? (local emergency communications, technical experimentation, packet radio networks, repeaters, ATV)

2. Should the Amateur Radio exam include irrelevant sections that take up valuable study time better spent learning more about radio itself?
(Not applicable to exams testing for license classes, present or future, that focus on, or include significant portions of CW subbands)

> The private country club where I am a member decided to go semi-private.
> In addition to the members (who had paid $10,000 to join the club), anyone
> could use the golf course for an $18 green fee.

Sounds like those guys decided to give the club away. Maybe the $10,000
membership fee was too steep. Maybe at $5,000 you could have tripled the
membership without bringing in the riff-raff.

> The course rules were posted on a large sign at the entrance to the pro
> shop, the back of the score cards, and at numerous places around the course.

Do you think people really read the rules?

> The course, which had always been well maintained, started to go to pot.

> drove their carts anywhere they felt like, gouging deep ruts in the
> fairways. Cigarette butts and beer cans were everywhere. Members who
> politely asked offenders to clean up their acts were threatened.

Mixing members and non-members won't work. I can tell you that.
If members were doing the maintenance, then it is because they feel they own
a part of it. The "customers" of course do not.

> These abuses were finally stopped when the club reverted back to private
> membership only. If I had to decide between shutting the club down or let
> the non-members back on the course, I'd rather see it shut down...

There are alternatives. You really should consider them. For instance a
membership fee based on ability to pay would allow members that could not
pay the $10,000 to become members and feel they are a part of it (unlike
the customers who don't have to come back the next day). Letting some
members in at $3,000 with lesser privileges (such as no access to the club
sauna or swimming pool, only privileges limited to the first 9 holes).

Suppose I played golf. I cannot afford $10,000 to join. But if golf were
a common pasttime for me, I would consider $3,000 and because that is a
significant chunk of my earnings, I would feel very a much a close part of
the club (as long as there are others like me) even if I don't get to use
some exclusive parts of the club reserved for rich doctors and lawyers.

> How does this relate to ham radio? Simple. It's human nature that people
> don't respect that which is unearned. The 5 WPM code requirement is so
---

I agree with that, but....

> trivial that any arguements against it being retained as a license
----

The Morse Code exam does NOT make people feel they have EARNED a ham radio license. It might for some people, especially those interested in working DX on the HF bands, but it doesn't for everyone. The CW test will not go any further to instill the idea that the license was earned for the people whom we are blocking from being part of ham radio.

In fact, for the people who are interested in VHF/UHF/SHF radio experimenting, ATV, packet radio, emergency communications, the fact that there IS a CW test will make them feel that the license is LESS earned just because when they actually start using that license, the skill they had to acquire to get the license is USELESS to them.

> requirement just don't hold water. The so-called barriers people have with
> respect to the code are psychological--they don't even give themselves a
> chance before they've convinced themselves they can't learn it.

The issue is NOT barriers. There are a very few people who really cannot learn code. I for one have a hearing impairment that makes it impossible for me to copy code if the frequency of the tone is in the range of about 600 hz to 2400 hz, and above 4000 hz. I can't hear the modulation of the tone in that range even though I can hear the tone quite well. Most code tapes are not usable to me. I did finally learn the code because someone was willing to help. But I did learn it because code is relevant to me. I do want to operate Morse Code. Unfortunately in my zeal to get licensed, I learned the code the wrong way. I'm starting over.

Do NOT assume that everyone is the same in this world.

> Using a similar arguement to the one used by the "no-coders", why don't we
> delete most of the theory exam as well? One doesn't need to know Ohm's Law
> to go down to Ham Radio Outlet, buy a radio and antenna, and use it on the
> air, do they? Of course they don't, so why should they be forced to learn
> something they will probably never use?

This is NOT a similar argument. The basic reason is that Ohm's law is very relevant to Ham Radio. Of course you can come up with specific cases where it is NOT relevant, but hams can't limit themselves to them. One does NOT need to know Ohm's law to hand over a VISA card. One does NOT need to know Ohm's law to screw in the cable on the connector marked "Ant". One does NOT need to know Ohm's law to plug in the radio, turn on the power, and push the mike button and talk. Sure, ANYONE can probably make a working radio transmit.

What are you going to do when you find a deal where you can buy a huge spool of 75 ohm cable-TV hardline real cheap ($0.01 a pound?). Are you just going to hook it up thinking it will work just fine? Are you going to back off because the impedance isn't right? Are you going to build (or even buy) a matching network that can make it work? You DO NEED to know some theory to know what can and cannot be done in these cases. You DO NEED to know Ohm's law when you are studying that theory and many others.

Ohm's law does not by itself apply in very many cases, but IT IS THE FOUNDATION of most of the rest of the theories of radio.

I suppose you'd want to remove the requirement of methematics from the study of engineering just because many engineering graduates end up in jobs where they don't have to work out any math themselves (they go into management or use CAD/CAM computers). Math is still required because it is fundamentally necessary for further learning in the field of engineering.

> I just don't understand the attitude of people who think ham radio's salvation
> lies in hordes of ignorant operators who care little about the institution
> invading the bands.

The reason you are having trouble understanding it is because this is not even the reality. Why did YOU choose to say "ignorant"? Does dropping the CW test and doubling the theory test mean that ignorant people are going to get into the hobby where they didn't before? Of course not. For one thing, the hobby is already full of ignorant people. We need so more COMPETENT ones, ones who not only KNOW Ohm's law, they know where to use it, and understand all the other radio theories which rely on Ohm's law.

Source record: 17895

Generally speaking, "trickle" type nicad chargers have a more-or-less constant current output of 1/10 the milliamp-hour capacity of the battery they are used with, and a charging time of about 15 hours. So your charger should be marked as putting out 27 ma (or perhaps 30 ma). Higher output chargers which incorporate some form of battery charge state or temperature sensing and current cutoff are available as options; these have charge time of 5 hrs (my Yaesu) or 1 hr (my Kenwood).

The reason you have to charge the battery for 15 hrs at the "ten hour" rate is a). the current tapers off somewhat as the charge progresses, and b). the charging process is not 100% efficient (ie, some of the current is converted to head).

For maximum battery capacity, be sure to run your battery down (or mostly down) before recharging it -- repeatedly running it down only a little and then charging will (temporarily) reduce its capacity. Also, after a few cycles,a new battery will exhibit somewhat increased capacity.

1605. Enhanced Kenwood R-1000 For Sale

Newsgroup: rec.ham-radio
Date: 1989-07-17 23:42:20 UTC
From: twt@hpfclp.SDE.HP.COM
Message-ID: <7650001@hpfclp.SDE.HP.COM>
Source record: 18116

The R-1000 is a general coverage receiver for broadcast, shortwave, and amateur listening. It covers 200 kHz through 30 MHz for reception of SSB, CW, and AM with digitally synthesized tuning. It has 3 selectivity modes:

2.7 kHz for SSB/CW
12 kHz for AM (wide)
4 kHz for AM (narrow, shortwave)

This last mode is provided by an upgrade of the standard 6 kHz filer which came with the set.

I've owned this set for four years, and it is *hot*. I'm selling it because I decided to upgrade to another Kenwood, the R-5000, to take advantage of the digital memory presets which that (much more expensive) receiver offers. I paid $400 originally for the reciever, and the better filter cost about $50.

I'm willing to sell it for $300, plus the cost of UPS COD (should be no more than $15). The instruction manual is included.

Write me a note or call if interested. I'm:

Tim Tillson

**** UoSAT-OSCAR-11 BULLETIN - 192 14 July 1989 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UoSAT D and E **

This week has been very busy for the UoSAT Spacecraft Engineering Unit, as a complete engineering model of the UoSAT D+E spacecraft has been put together: the structure with boom motor plus engineering module-boards in the module-boxes. Engineers spent many hours into the early morning assembling the satellite, in order to get it ready for the vibration test, which commenced on Wednesday, 12th of July at the Royal Aerospace Establishment (RAE) at Farnborough, England.

The spacecraft is now going through qualification vibration tests at 14g rms. By Thursday night the Z Axis sine and random tests were completed and currently the 1000 G shock tests are being performed. After these have been completed, the tests are repeated in the X and Y spacecraft axes. UoSAT Director, Dr Sweeting (G3YJO), reported that the sound produced by the vibrator machine is louder than that of an underground metro train passing by in a narrow station. The violent vibration does not seem to do the spacecraft much harm. Apart from a

few bolts which worked loose, the structure is strong and it will withstand the 'shake' experienced at launch without difficulty. UoSATs D and E, which after launch and separation from the launcher will probably become UoSAT-OSCAR 14 and 15, both have the same mechanical structure, weight and dimensions. They will be the first microsatellites separated from the ASAP - followed by the four Microsats, which from then on will be known as OSCARs 16, 17, 18 and 19. The current launch date is the 10th of November - with a 10 minute launch window around 0200 UTC. Fingers crossed!

** DATASPACE-89 **

Don't forget the AMSAT-UK/RSGB Data & Satellite Colloquium between the 27-31 July at the University of Surrey! The programme will be placed in the next UoSAT Bulletin. A few places are still available - if you hurry - call Jackie at UoSAT on (0483) 509143.

** RS 12/13 **

WA2LQQ, Vern Riportella paid a visit to the RS command station in Moscow earlier this month. He reported that the RS12/13 package is ready to fly, but is still grounded. It was already placed into the satellite at the end of 1988, but the launch depends on the demand of the maritime navigation system (base primary payload). The launch will probably be sometime during 1990.

> *deleted*]

For a little balance... I've had nothing but good experiences with HRO.
I've dealt with them in Van Nuys and Burlingame, CA. Their prices were
excellent and service was first rate. I had one handheld have a problem
on initial purchase, but wasn't able to bring it back in for a month. The
Van Nuys store said "no problem" and had it serviced and back to me in
short order (it was under warranty, but it is notable that the work was
done quickly).

The people running these stores were knowledgable and helpful. I heard
no complaints about them on the either the LA or SF repeaters in seven
years in these areas. You guys may have had some problems with your
stores, but out here it's a different story.

Hasn't the experience of the CB bands provided one more in a long list
of proofs to the axiom that one does not respect what one does not earn?

I wonder how many of these no-code proponents can even copy five words per
minute... or build (or repair) even one piece of gear in their shacks.

Contrary to the poster's opinion, I know a lot of hams who can drive. I do
not know too many who can re-pass the test for their present class of license
without a lot of study.

I may have the wrong impression (and I am sure I will be told about it :-))
but it seems to me the no-coders did not have to work as hard as I did to
earn my license. If they had, they would not be so hasty in their desire
to turn us into CBers. I had to trundle down to the FCC office in the big city
to take the tests and CW came very hard to me. But, I wanted it very badly
and I worked hard and I earned the right to be a ham. I hope our bands do
not get any more like the CB band than they already are. How much respect
for ham radio do you see on the bands now, even from those who are
supposedly earning their licenses?

Explain to me why it makes sense to throw away our only claim to fame and
spectrum... the fact we have to earn our licenses. I must be getting old,
but it is hard for me to understand how it helps ham radio to throw away
the one thing that separates us from the CBers. I will never work ATV, but
I sure had to study it to pass the Extra. Let's do away with those exam
questions, since they are unfair to anyone not wanting to study ATV. I
do not plan on operating any FM, so I should be exempt from any questions
regarding FM. In other words, where do we draw the line? How about a
beginner's no-theory license, so they can learn theory by doing (sure).

So, explain to me why.

>Phil Howard, KA9WGN Research Programmer, Computing Services Office

Please speak for yourself, Phil, but don't speak for us VHF/UHF/SHF/EHF
experimenters. The fact of the matter is, when you're working with very
weak signals and you have a limited budget, you do everything you can to
eek that last bit of performance out of your equipment. CW is naturally
the way to go. It is cheap. It is easy to use. Equipment is simple so
you can drag it up the mountainside. No special computers are required
for fancy DSP signal processing. CW has about a 10 dB advantage over
SSB, and SSB has a large advantage over FM. Those of us who are up on the
bands above 902 MHz use CW *ALL THE TIME* for just those reasons. Please,
Phil, don't use your argument where VHF/UHF/SHF/EHF experimentation is
concerned; it doesn't work. And please don't speak for groups to whom
you don't belong. Thank you. 73, and please join us (on CW) above 902.

1612. Does code make for better operators?

Newsgroup: rec.ham-radio
Date: 1989-07-18 10:36:42 UTC
From: PJML@IA.NWL.AC.UK
Message-ID: <18.Jul.89.11
Source record: 18124

Code vs no-code - this one again! Well here in Enlightened Europe, we
have harmonised licenses and no-code. Up to 26DbW (thats about 400watts to
those of you who measure power at the amplifier - we measure power delivered
to the antenna) on 50MHz and up. This has been the case for many years
(introduced early sixties? i dont go back that far!).
The power limitations etc. are the same whether you have passed the 12WPM
code test or not - its just that you cant work HF without code.
As to whether it has led to a 'drop in standards', well, some of the goings-on
on 2M repeaters leave a lot to be desired, but the same could be said of
the HF bands. Us 'class B' licenses (the no-coders) can sit back smugly
during the middle of an HF contest and point the finger accusingly at the
bad operating practices, rudeness, and antagonistic behaviour that always
seems to show up, and we turn our heads in sorrow..... then try and work
the bad operators on VHF and teach them politeness by example.
If code proficiency is such a brilliant tool for separating the men
from the riff-raff, just listen to the HF bands, and you may change your
mind. I *DO* work HF (but not on ham bands!) and with *PROPER* operating
procedure (politeness, dont speak until spoken to, proper net control) it
IS possible to work large nets efficiently and without it all degenerating
into chaos. Similarly, i have run VHF nets with 300 (yes three hundred!)
members, and during a ten hour period, there was not one instance of
doubling, operators going 'out of turn' or any other such misdemeanours.
In comparison to a professionally run net, the ham bands look a shambles, code
or no-code!
If we are to attract new members to ham radio (and we need to do this just
to keep our population stable) we *MUST* improve our standards of operating,
to Mr. Average, it sounds like the tower of Babel! Remember, what Mr. Average
doesnt understand, he is unlikely to support, and no support will in the
end mean no hams, no ham bands, but more TV/broadcast dross!

The standards of operators are to a great extent moulded by example. Code
vs no-code is an irrelevant diversion. Proper operating standards are by no
means the sole property of the code junkies.

From: glenne@hpnmdla.HP.COM
Message-ID: <1250054@hpnmdla.HP.COM>
Source record: 17878

Hi
From what you describe, I expect it will require a pretty good unlocked
VCO performance to get a clean output. With as low a reference frequency
(high divide number) as you have you probably can't expect more than
a few hundred Hz loop bandwidth at best. This means you get whatever the
VCO does everywhere further out.
One way to avoid this is to hetrodyne the VCO down to a lower i-f where
you can use a larger reference frequency and consequently a higher loop
bandwidth. Work on getting high Q elements (loaded Q too) in the VCO first
so that it is a good performer and then lock it.
I don't know what to say about the sidebands way out, since they must be
well beyond all the loop/reference sorts of frequencies. You might try
reducing the loop bandwidth to a *very* small value, like 1 Hz or so, or
running the VCO from a battery to see that it isn't a problem with the
unlocked VCO. Overcoupling and moding can sometimes give those sorts of
sidebands on an oscillator.
If the VCO is clean, and the sidebands are being put on it
by the loop you may need to look for additional poles/zeros in the integrator
etc. which might be involved.
In general, first make the best unlocked oscillator you can, pick a
design (hetrodyned, nested loops etc) which allows a high enough reference
freq and loop bandwidth to clean up that which needs cleaning up.

I agree that it beats crystals!

An area ham has been clocked as speeding on police radar even though he feels that he wasn't speeding. He was transmitting on 2m at the time.

Ignoring other non-radio factors such as speedometer error, tire size, etc., is there a possiblity that the RF signal interferred with the radar gun?

Anyone have any theories?

>eek that last bit of performance out of your equipment. CW is naturally
>the way to go.

You make a good case for needing CW, but not for needing a CW TEST!

Learning CW is only one of a great many skills you need to succeed at that kind of experimentation, probably one of the more easily acquired ones too. The others (like adjusting receiver front ends for low noise figure) you learned because you HAD to, not because of any test.

Same thing with DXing, I passed 20Wpm THEN really LEARNED CW - so I could succeed at DXing! I had already passed the test, but actual "in use" DX ability with CW needs far more than the test. Listen to 14.002-14.005 just about any time to see what I mean.

You need a lot more than just being able to copy CW to successfully "dig through" a big pileup. I know several people who can "beat out the pack" just by knowing how to operate CW WELL.

The proposal is not to discard CW or even to restrict CW in any way, the proposal is to drop the TEST and only the test. If indeed CW is useful then hams will learn it for the same reason hams have learned every other skill needed to operate - because it is needed, not because it is "traditional".

1620. Re: Why is ordering a pizza via the autopatch bad? (semi-long but good)

Newsgroup: rec.ham-radio
Date: 1989-07-18 18:02:37 UTC
From: pfluegerm@gtephxgtephx.UUCP
Message-ID: <447f5cfd.15840@gtephx.UUCP>
Source record: 17884

I'm afraid the handwriting is on the wall... very few people involved with this hobby seem to want any progress, and I'm afraid its going to kill amateur radio.

Amateur radio was originally established, condoned, and supported because hams were doing very relevant pioneering work and pushing the state-of-the-art. And, as with most technology, there was a military/emergency advantage to be found in having skilled radio operators WITH equipment. Anything else is secondary.

These are still the basic reasons we're around (it's not just a coincidence that commonly used military frequencies are right next to our ham bands). But, we're getting to be like that annoying relative who overstays his/her welcome. We're contributing NOTHING and becoming a thorn in the FCC's (and business') side.

We've got to ask ourselves, why should the FCC and WARC keep us around? What do we contribute? Why not give our prime real-estate (frequencies) away? WHAT'S *YOUR* ANSWER. (just because that's the way it's always been and we are a relatively SMALL group of old codgers is not sufficient).

We have failed to progress with technology, because we have failed to push the status quo. We are afraid to experiment - with the technology or the rules.

What's wrong with ordering a pizza on the patch? I don't believe that it violates the intent of the rules - we're not running a business. They didn't call or solicit me, I chose and called them. I didn't haggle over price. (Yes, legally it is a contract and money will be exchanged, but the intent was not to further any particular business, it was because I was hungry. I was in control of the communication. It's just a pizza. And emergency traffic can break in on patches BETTER than it can break in on our normal, "banal" :) conversations since only ONE ham is transmitting, carrying on 50% of the conversation. The call can be broken in on and dumped (with explanation please: "W1XX EMERGENCY, BRINGING PATCH DOWN") at any time. Anyone that has problems with THIS is going to cause OTHER problems (e.g. jamming hurricane nets...). I've heard ragchewers time 3 minute repeaters out in one breath, leaving no space for breakers. When someone does break, these people often don't respond to breakers until a round or so later. Have I killed the emergency argument?

What we need to consider in the rules is *intent*. I must admit, the current wording of the rules *seems* to indicate that ordering a pizza is not permitted. But, the intent was to not have the amateur service be an alternative business band, for regularly conducting business - "Fred, you are being dispatched to Joe Smith's house to repair his air conditioner (Fred being an AC repairman at work)", and the taxis on 10M are examples of what was clearly NOT intended.

And we DO need to look at intent - when the constitution was written, the forefathers could not have foreseen TV and radio, but that clearly does not mean that freedom of the press doesn't apply, right? If everyone went by the letter of the law, never questioning it, most progress would come to a halt. The FCC probably didn't foresee

autopatches when the business rule was written. There are always going to be gray areas - in opposition to some hams who apparently think it's all black and white. And these gray areas need to be probed and tested. The reverse autopatch was a controversy too, a while back. Same arguments, that it was against the literal interpretation of the rules, etc. But, thanks to a few brave souls who tested the waters, the reverse patch now seems to be generally accepted. Cheers to those control operators who are permitting pizza ordering.

I think we simply need to control ourselves and use a little sense. If we don't abuse it and do control it, what will the FCC say? The FCC is not God, and those rules were written by people, who must have some sense of reason. :) And we're certainly not hurting Ma Bell because the patch line at the repeater is a residential line paid for monthly, JUST LIKE THE PHONE LINE AT HOME, on which you can also call for a pizza (and no, you don't need a commercial line to order a pizza, as some have implied). In fact, she'll be making more money on measured-rate lines.

We've become a stagnant bunch, never challenging those gray areas, never pushing forward.

What contributions have we hams made lately? We're really just appliance operators these days. I know, we all love those fancy rigs with all the gadgets, myself included, which has caused a significant drop in the knowledge of basic radio and electronics theory. I get very annoyed when I hear two hams on a repeater, and ham A gives ham B a "30 over S9" signal report. This explains why we aren't building and experimenting with new techniques like spread spectrum - if it doesn't come in a pretty box from Japan, we don't want to know about it. But, we still have a chance to redeem ourselves. We could experiment with new modes and techniques which don't require "radio" skills, but stretch our imaginations to combine radio with other blossoming fields using computer control, digital transmission and signal processing, frequency hopping, and the like. I know some people think packet is new, but it's simple X.25, which I was doing for the company here in 1981, and it was mature *then*.

Given that the mean age of hams is getting up there, we need new blood to bring in the knowledge and UNENCUMBERED, FORWARD THINKING people that can accomplish this.

These people don't want to waste their time with learning such an archaic form of communications as CW. I mean, yes, it's got distinct advantages in getting thru when other modes can't, but our computers can do it, so why should I learn it? I've never bothered to learn baudot so I could copy slow speed RTTY. It's possible, but why should I?

So many people are saying that we'll turn in to another CB band - you seem to be equating no-code with no-theory. This is not the case. In fact, I'd like to see the theory beefed up, relative to CURRENT technology - it's apparently too easy now, because so few of us seem to know what we're doing on the radio.

I'll end the way I began - I'm afraid the handwriting is on the wall... very few people involved with this hobby seem to want any progress, and I'm afraid its going to kill amateur radio.

But we have a golden opportunity RIGHT NOW (NO code, YES pizza) to turn it around.

I dislike anonymous posts.

In article <165@swituc.UUCP> root@swituc.UUCP (Admin) writes:
>In article <2759@splut.conmicro.com>, jay@splut.conmicro.com (Jay Maynard) writes:

>> Someone who doesn't want to be a ham badly enough to fulfill the
>> requirements of obatining a license doesn't deserve to be one.

No one is proposing to abolish licensing or even to make things "easier",
only more relevant to modern operations.

>Hasn't the experience of the CB bands provided one more in a long list
>of proofs to the axiom that one does not respect what one does not earn?

Oh you mean like the Novice License, Technician License, etc. etc.?
Do you remember the term "video ranger"?

>I wonder how many of these no-code proponents can even copy five words per
>minute... or build (or repair) even one piece of gear in their shacks.

This one can copy 35-40 wpm, has over 200 countries on CW and has built or
repaired everything in my shack. Including the computer and first run TNC-2
kit that I use.

>Contrary to the poster's opinion, I know a lot of hams who can drive. I do
>not know too many who can re-pass the test for their present class of license
>without a lot of study.

Skills like CW that are not used tend to deteriorate. A good argument for not
requiring them in the first place!

Those who need and use CW will continue to do so regardless of any new
licenses! Those who don't will pass "the test" and quickly forget that they
ever had to learn CW.

>I may have the wrong impression (and I am sure I will be told about it :-))
>but it seems to me the no-coders did not have to work as hard as I did to
>earn my license.

After 16 years as VE3BYO (15wpm) I moved to Florida and failed the 13 wpm CW test,
ending up as WB4YKO - Technician. It took a year of study and USE of CW to
get to my present speed. I passed the Extra exactly one year later with no
errors on the test, I also organized the FCC testing at the Melbourne Hamfest
that year in part so I could take the test!

Tell me about working hard to pass the test ...

>If they had, they would not be so hasty in their desire
>to turn us into CBers. I had to trundle down to the FCC office in the big city

>to take the tests and CW came very hard to me. But, I wanted it very badly
>and I worked hard and I earned the right to be a ham. I hope our bands do
>not get any more like the CB band than they already are. How much respect
>for ham radio do you see on the bands now, even from those who are
>supposedly earning their licenses?

Its not working so lets keep doing it?

There have always been LIDS and always will be, no testing will change that.

>Explain to me why it makes sense to throw away our only claim to fame and
>spectrum... the fact we have to earn our licenses. I must be getting old,
>but it is hard for me to understand how it helps ham radio to throw away
>the one thing that separates us from the CBers. I will never work ATV, but
>I sure had to study it to pass the Extra. Let's do away with those exam
>questions, since they are unfair to anyone not wanting to study ATV. I
>do not plan on operating any FM, so I should be exempt from any questions
>regarding FM. In other words, where do we draw the line? How about a
>beginner's no-theory license, so they can learn theory by doing (sure).

This is the only "no test" proposal I have seen. The serious proposals are
actually making the test HARDER! The big difference is that CW is not used by
the vast majority of hams in the vast majority of operation.

It is not used in ANY commercial service, nor in the (US) military.

>So, explain to me why.

I might also ask - why a CW test? Why not say a test in Sanskrit or
Esperanto? None of your arguments apply any less to that kind of test.

I hate anonymous postings - to me they indicate a lack of courage on the part
of the poster. Is that what we need in Ham Radio?

1623. HT NiCad Batteries

Newsgroup: rec.ham-radio
Date: 1989-07-18 19:35:52 UTC
From: faunt@CISCO.COM
Message-ID: <8907190703.AA06334@ucbvax.Berkeley.EDU>
Source record: 17896

I sent some of this information to AllanWS by mail, but I guess it may be of general interest.

First, the W & W ICOM-7S is 13.2v @ 1100 mAh, rapid base charge or "slide-in" charge only. This mistake was due to a mistake in their literature. I have one for my IC32, and while it makes the unit a little clunky (it's 4 1/4 inch long), I like it.

There's also a company in Burlingame (I think)(SF peninsula) called Delcom that sells 2AT clones, and battery packs. The interesting one for me was a pack that holds 8 AA cells, either NiCad or non-rechargeble, that has charging circuitry for 13.2vDC input. The pack cost $15. empty, and I got a small 100ma wall charger to match for $5. I plan to load it with 700mAh Nicads which will give 9.6V at 700mAh. It can be used with the cigarette lighter cord to charge the unit. It appears that with either the wall charger or cigarette lighter cord, you could operate while charging the pack, with the batteries supplying the excess current required for transmit when using the wall charger. It's at home, or I'd tell you the size.

1624. G5RV Antenna

Does anyone have the design info for the G5RV antenna ??? Also I'm looking for any theory behind it such as how did they derive the overall length, and what changes if any are needed when changing the feedline from 300 ohms to 450 ohms. Also should a balun be used where the ladder line connects to the coax ?? Thanks

A couple of the guys here (Jer/ N0FZD included) bought 40 of the new 1300maH NiCads from Yost (Mr Nicad). We also got the ICOM plastic, too. We've measured the capacities, matched them, and are now assembling. We expect 9.6v @ 1300+ maH in a 3.5" case. I don't have the prices handy, but it was SIGNIFICANTLY cheaper than buying from ICOM. If you're the adventurous home-brew type that has a little time, I'll be posting the details later, after I know it works.

1626. AutoLog: Computer (IBM) control of ICOM radios with logging

Newsgroup: rec.ham-radio
Date: 1989-07-18 21:36:57 UTC
From: rbono@necis.UUCP
Message-ID: <1097@necis.UUCP>
Source record: 17899

A new version of AutoLog has been sent to Keith to be
placed into the SIMTEL archive server. AutoLog allows the control
of an ICOM radio for *ANY* ICOM radio that supports the ICOM "CI-V" bus.
AutoLog allows your computer to become an "extention" of the front panel
of your radio. Frequency, mode, memory channels, etc. may be controlled
either from the Radio, or from the Computer. Logging is handled and
provides "instant" updates to previous contacts of the current station.
All contacts are kept in RAM for *FAST* operation. 640K system ram will
allow more than 5,000 contacts per log file. The program will also
calculate greate circle short and long path distances for DXCC-prefix
countries and for selected cities in the USA and Canada.

This version is for the IBM and compatibles using DOS version 3.0
or newer.

Most of the changes to this version are to make operation of the
program smoother. A "configuration" program and function is now supported
to help users configure the system. There are no major new features over
previous versions (this is version 0.9). This version will not "HANG" if your
CI-V interface is not connected. Other changes suggested by the ICOM radio
club have been incorporated (note: This is not an endorsement by ICOM).

This program is considered "shareware", but my "trial" period does
NOT specify any length of time. NON-profit shareing of this program is
encouraged. No-Source code is available.

If anyone is working with this (or a previous version) I would
like feedback on how you like it. Many have told me that they are using
it, but I have not received *any* bug reports (and I don't beleive that
anyone can write *bug free* code!) ;-)...

NOTE: With this version, my previous offer of getting a no-cost
copy of the software directly from me is being withdrawn. I have found
myself spending too much time copying disks, and stuffing the mail box.
Therefore, if anyone wants to get the latest copy directly from me, they
MUST send me the following:

1) A pre-formatted 5.25 inch MS-DOS diskette
2) A self addressed diskette mailer with enough return postage
to insure that the US post office will deliver it to you.
3) The shareware fee ($20.00 US dollars, NO STAMPS).
4) Don't forget to tell me that you want AutoLog. Many have sent
me a diskette without specifying what they want (I have several
pieces of software available).

Or you may get a copy of AutoLog for trial use at no cost from
others as long as they abide by the simple rules specified in AUTOLOG.DOC.

Rich Bono, NM1D

Also, please don't send anymore packet email concerning AutoLog. If you
have no email path to me, send all correspondence via the US mail to:
Rich Bono
7 Redfield Circle
Derry, NH 03038

1627. Re: ARRL NR 38: HAM LICENSE FEE PROPOSE

Newsgroup: rec.ham-radio
Date: 1989-07-18 23:01:06 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500072@ux1.cso.uiuc.edu>
Source record: 17900

I would be in favor of the fee, provided that the fee pays for the costs of processing licenses as well as the costs in enforcing violations of FCC regulations and US code as it pertains to the Amateur Radio frequencies.

It is possible that the license fee may be increased in proportion to the costs of the bandwidth allocated in terms of commercial uses. Of course there would be a massive outcry. I'd hope there would not be for the $30 fee. Although I think it is a little high for some people, it is not out of reason. If someone has trouble getting a station together, hams usually chip in and loan the guy equipment. The same can be done for the license fee.

There would be some dead wood drop out with the $30 fee, but assuming that the number stays around 400,000, times $30, divided by 10 years, that would generate $1.2 million a year for the FCC to deal with ham radio with.

If a code-optional license structure starts up, we might see a doubling of he number of hams over a few years of growth. That can help add to the enforcement power of the FCC.

I am in favor of the fee, and recommend cautious treading.

--Phil howard-- <phil@ux1.cso.uiuc.edu>

Charging time for the BP-70 on the wall charger is 9 hours. It is given in the ICOM literature. I believe it is on the sheet that describes the various optional accessories and battery packs.

There is a power adapter you can get that fits on the bottom like a battery, but is much shorter. The 13.2 V input on the BP-70 is apparently for the purpose of charging the battery from a 13.2 volt source.

SB ALL @ AMSAT $ANS-196.01
BALLOON LAUNCH PLANNED

HR AMSAT NEWS SERVICE BULLETIN 196.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 15, 1989
TO ALL RADIO AMATEURS BT

Planned Balloon Launch To Commemorate The 20th Anniversary Of The Moon Walk

To help commemorate the 20th anniversary of man's first moon walk, two radio amateurs will be launching a balloon that will have as part of its telemetry beacon a "digitized" voice reproduction of President Kennedy's address to Congress authorizing the manned space program. Also, listeners will hear a "digitized" reproduction of former Astronaut Neil Armstrong's famous words as he made the first step upon the moon's surface. This balloon launch is the idea of radio amateurs Carl Lyster (WA4ADG) and David Fields (N4HBO) who live in the Knoxville/Oakridge, TN area. The launch of this balloon, which coincidently will occur at the end of SPACEWEEK 1989, is planned to happen on Saturday, July 22nd between the hours of 7:00 A.M. to 8:00 A.M. EDT. The two pound balloon package will consist of three lithium battery-powered transmitters: 1) an FM transmitter with an RF output of 3 watts on a frequency of 144.34 MHz, 2) an HF transmitter with about a quarter of a watt output on 28.866 MHz, and 3) an aircraft Emergency Locator Transmitter (ELT) which can be heard on a frequency of 121.60 MHz. The first beacon at 144.34 MHz will contain, in addition to the "digitized" voice transmissions, a telemetry "stream" which will consist of the station identification, temperature, and power supply information as the payload makes its ascent to 100,000 feet dangling from a 12 foot diameter weather balloon. The telemetry data will be sent via packet radio at 1200 baud. Telemetry will also be sent in a ASCII format at 300 baud with the following characteristics: 7 data bits, 2 stop bits, no parity, and modem tones of 1200/2200 Hz with the start bit at 2200 MHz. The HF beacon at 28.866 MHz will likewise provide identification and telemetry data on CW at 7 WPM but no "digitized" voice transmissions. All telemetry transmissions will occur at 2 minute intervals. The third transmitter, the ELT, will be used in conjunction with the Civil Air Patrol (CAP) to help locate the package after the balloon carrying it aloft bursts at approximately 100,000 feet; a parachute will bring the payload safely back to earth. Finding the transmitters after their decent to earth will provide a valuable training exercise for the CAP personnel located in that area. Based

on previous data, it is expected the balloon will be aloft for about three hours and stations as far away as 500 miles should be able to hear the 2M FM beacon. All stations who are planning to monitor these transmissions next Saturday are asked to make note of the altitude and azimuth bearings along with the times, and to please monitor both the 2 meter and 10 meter signals to observe fading and other propagation characteristics. Listeners are urged to tape record the signals and to make the recordings available to N4HBO and WA4ADG for post-flight analysis. There will be a "pre-launch" net on Saturday, July 22nd one hour BEFORE lift-off on 7.155 MHz. If some reason that the balloon launch cannot occur on Saturday morning, the "back-up" launch time will be at the same time on Sunday, July 23rd with the "pre-launch" net again occuring one hour before lift-off. If you would like further details about this event, please contact Carl at (615) 588-7120 or Dave at (615) 482-5155.

[NOTE: In a late breaking ANS item, Bill Brown (WB8ELK) will also be launching a ballon from Wapakoneta, OH from the Neil Armstrong Air & Space Museum later at around 12:00 P.M. EDT that day. His balloon package will have a fast scan or ATV transmissions at 439.250 MHz with telemtry superimposed on the picture. Those wishing to receive these pictures should also listen to the "pre-launch" net at 7.155 Mhz around 11:00 A.M. EDT.]

SB ALL @ AMSAT $ANS-196.02
ZRO TEST UPDATE FROM WA5ZIB

HR AMSAT NEWS SERVICE BULLETIN 196.02 FROM AMSAT HQ
SILVER SPRING, MD JULY 15, 1989
TO ALL RADIO AMATEURS BT

ZRO Memorial Achievement Award Program On AO-13 Proves To Be Poplular

Andy McAllister (WA5ZIB), AMSAT-NA Vice President of User Operations and "test" conductor for the ZRO Memorial Technical Achievement Award Program (or ZRO Test for short), reports that the first two sessions of the the ZRO Test on AO-13 July 1st and July 8th went very well. For those unaware of this activity, the ZRO Test allows AO-13 users to gauge their stations receiving efficiency and their operating skill. The usual practice during the ZRO Tests is to send random CW five-digit code groups at progressively lower signal strengths through AO-13 with the emphasis on copying correctly as many code groups as possible. Initially, the signals which are sent at level "zero" correspond to the signal strength of the telemetry beacon; thereafter, signals become progressively more difficult to copy. During the most recent ZRO Test, several stations copied down to level "eight" which is 24 dB below the signal strength of the beacon. One participant, W7KIV, submitted the first "perfect" score at level "nine" from the July 1st session; runners-up at that level included WB6LLO and W7ID who copied four of the the five digits correctly. At level "nine," WA5ZIB had an output power of 86 milli-watts!

If you wish to participate in the upcoming ZRO sessions, please take note of the following times:

Sunday July 16, 1989 at 07:20 UTC
Saturday July 22, 1989 at 20:50 UTC
Saturday July 29, 1989 at 04:20 UTC
Saturday August 12, 1989 at 20:20 UTC

All transmissions from the control station use CW at 10 words-per-minute. Please avoid transmitting near the 145.840 MHz downlink frequency during ZRO Tests. The above dates and times have been carefully chosen for best coverage and squint angles. Any changes will be announced as soon as possible. ZRO brochures are still available from WA5ZIB for an S.A.S.E. with one unit of postage. If you wish to inquire about receiving your ZRO Test brochure or certificate, write to: Andy McAllister, WA5ZIB, 14714 Knightsway Dr., Houston, TX 77083. Good luck!

AO-13 TELEMETRY PROCESSING S/W

HR AMSAT NEWS SERVICE BULLETIN 196.04 FROM AMSAT HQ
SILVER SPRING, MD JULY 15, 1989
TO ALL RADIO AMATEURS BT

Project OSCAR Offers A AO-13 Telemetry Processing Utility Program

Individuals interested in AO-13 telemetry can process data files created by P3C.EXE using the "P3C Utility Program." The utility is written for PC compatibles. The program is supplied in compiled form on two 360K diskettes. While the program P3C.EXE processes AO-13 telemetry in real time, this utility program adds to your capability to "post-process" files created by P3C.EXE. Some of the unique capabilities of this new WB6GFJ program and what you might wish to use it for are briefly given as follows:

1. Text messages (K, L, M and N blocks) may be pulled out of P3C.EXE and sent to the screen, printer, or to an ASCII disk file. This allows for easy re-transmission of important PSK messages to your local BBS, newsletter or PBBS.

2. Y-Blocks can be retrieved from P3C.EXE files and redirected to the screen, printer, or ASCII files. With minimal editing, the Y-Blocks are readable by the "W6SHP RTTY Telemetry Program." Individuals with a G3RUH PSK modem can supply Y-Block data files to friends only interested in RTTY data.

3. You have the ability to inspect 98% of the bytes within the SYSPAGE or Intermediate Event SYSPAGE of AO-13 telemetry. Selected bytes can be sent to the printer, screen, or ASCII files. This allows you to create ASCII files of a single byte of data and process the data to meet your own interests. Once the data is in ASCII format, it is a fairly straight forward project to create your own "code" to process the data. Also, with the data in ASCII format, it is no problem to transport the information into a spreadsheet program to create a plot a particular parameter versus time. When you select bytes from within a block, you may select from one to 128 bytes at one time.

This Utility is menu driven so that no additional programming is required to access P3C.EXE data files. However, since there is no tutorial regarding AO-13 telemetry, you should have some background in the field of AO-13 telemetry so you know what you are looking for. Program documentation is provided on the disk and can be viewed from within the program using one of the utilities. Documentation can also be directed to your printer with the DOS "print" command. A copy of the AO-13 Block Description written by Command Station DB2OS is also provided on the disk.

If you don't have a G3RUH modem, but know a friend who does, the Utility series can read any file created by P3C.EXE. Therefore, if you are interested in telemetry, have your friend supply you with data files. (Note: at this point in time, Project OSCAR does not supply additional disks of data files. If enough interest is shown, that option MAY be made at a future date.)

To find out how to acquire a copy of the Utility program, send a S.A.S.E to Project OSCAR at the following address:

Project OSCAR
P. O. Box 1136
Los Altos, CA
94023-1136

Please Note: Minimum Equipment Required to run this Utility program is a PC Compatible, 360K Floppy Disk, EGA Monitor

/EX
SB ALL @ AMSAT $ANS-196.05
AMSAT SHORT BURSTS

HR AMSAT NEWS SERVICE BULLETIN 196.05 FROM AMSAT HQ
SILVER SPRING, MD JULY 15, 1989
TO ALL RADIO AMATEURS BT

AMSAT Short Bursts

There is a AMSAT 17M Net which is convened every Sunday evening beginning at 23:00 UTC on a frequency of 18.155 MHz. Acting as Net Control Stations (NCS) are KO5I and N4QQ. This net provides another opportunity for those who cannot listen to the AMSAT nets on Sunday afternoon to still find out what is happening in the world of amateur radio satellites. So join KO5I and N4QQ on Sunday evenings for this new AMSAT HF net.

At the present time, the launch of the MICROSATs is scheduled for November 9, 1989. Since this falls within two days of the "normally" scheduled AMSAT-NA Space Symposium, AMSAT-NA officials have decided to change the date of this annual AMSAT event to the weekend of November 3rd, 4th, and 5th. If you would like to obtain more information about the AMSAT-NA Space Symposium, please contact AMSAT-NA HQ's at (301) 589-6062 or Ralph Wallio (W0RPK) at (515) 961-6406.

Courtney Duncan (N5BF), Manager of the AMSAT Operations Net, has issued the following schedule for the next several weeks for the times and frequencies of the OPS Net. These nets on AO-13 are designed to discuss the many happenings in the world of Amateur Radio Satellites. If you have any comments or suggestions to pass along to N5BF, you can leave them to COURTNEY DUNCAN on the AMSAT-NA BBS at (314) 447-3003.

AMSAT OPERATIONS NET SCHEDULE 1989

Day Date Time Orbit Frequency Local evening, U.S.

Wed 19 Jul 0230 840 435.970 Tuesday

Not forgetting a golf club and a few balls, a hammer and a feather, and probably some other interesting stuff too. Gosh, just think, hundreds of years hence, lunar archaeologists might find that stuff and wondered what must have gone on up there. The feather may cause particular consternation :-)
Or am I wrong? did the Apollo crews bring the hammer, feather, golf clubs etc back to earth?

> 73
> Gene WA1UXA

Well, let me present an alternative scenario. The FCC obviously wants this change badly. They would not have done an end-run around normal procedure if they did not. IF somehow we manage to block this move, we will have generated a great deal of bad will on the comission.

I believe us to be viewed in a bad enough light as it is. I have no inside information or anything, but I suspect the comission, and more importantly, the staff will mirror the opinion of the general technical professional community. Increasingly, when I tell someone I'm a ham, or worse, when I try to recruit a new member, I'm greeted with mild distain. A marked contrast to just a few years ago when the ham commanded great respect.

Why is this? Many reasons. Usually our archaic practice of hazing new members with CW is mentioned. As large a factor, I suspect, is the fact that ham radio contributes little to society any more. Whether it be technical innovation or emergency services or whatever, we lag many other segments of society. Occasionaly some segment of ham radio produces something significant; for instance, the HamSat program is poineering cheap sattelites. But if you measure even this contribution against the vast spectrum we command, it really pales against commercial concern. "But we're not commercial, we're hobby" you might say. True, but that has no effect on the value of our specturm.

Some (much?) of our failings are our fault, others are a result of the exponential growth of technology. But sit back and look at things from an FCC position. Great emphasis has been placed in recent years toward

getting government to think like businesses. That's good. Spectrum management becomes at least in part, a business decision.

From a non-ham, business man's perspective, there are these hams who are really just hobbyists who have vast, economically valuable spectrum space worth bunches, most of which is unused. Now we (the businessmen) try to allocate a tiny chunk of an almost unused band (they listen too) and the hams bawl like spoiled kids. From their perspective, moving up in frequency is a trivial exercize. After all, most any frequency between DC and 50Ghz has some sort of commercially available equipment for it. We piss'n'moan about how hard it is to move to 900 meg or 10 gig or whatever and the reasons we give are laughable to the commercial side (real to us, of course).

Then to top all this off, when the FCC starts an initiative to modernize the service and drop CW, we again cry like babies. So where do you think we stand with the FCC?

I think that if we win the 220 battle, we will have won a fight and lost the war. I think we should concede this one and work on cleaning our act up a bit. Maybe then we can justify holding on to the next chunk that comes under fire. All this current fight is going to do is make the other side sharpen up its tactics a bit.

Think about it...

>I decided that this was a group of people I wanted nothing to do with.

I think that HRO deserves a fair shake here in that there appears to be some variation between the different stores. My dealings with them have been mostly with the Burlingame, CA store and I have to say that I have witnessed none of the problems experienced by some of the other posters on this net with experiences in their other outlets. I too had considered becoming a ham for over 20 years and it was not until I visited the Burlingame store and chatted with a friendly OM behind the counter that I finally decided that I would go for it. Sadly, I've not since seen the gentleman there but when and if I do I'm going to thank him for the encouragement that the gave me.

I've also visited their Phoenix, Arizona store and found them to be helpful, courteous and friendly.

It does not surprise me that some of the stores are staffed by individuals with questionable character and I would suggest that each prospective buyer at least check out the individual store in their area rather than simply deciding to boycott them as a whole. Like almost any other large business, there are some good and some not-so-good people on the staff. I think that one should at least give them the benefit of the doubt and visit their local store before arriving at any general conclusions.

1637. How do I make a notch filter with cable?

Newsgroup: rec.ham-radio
Date: 1989-07-19 18:12:29 UTC
From: cyamamot@nunki.usc.edu
Message-ID: <4436@merlin.usc.edu>
Source record: 17911
Cross-posted to: sci.electronics,rec.ham-radio

Greetings,

I am trying to make a sharp notch filter to cut out an overbearing
paging transmitter that swamps my PRO-2004 scanner on the VHF bands. I
think I've read somewhere before about how one can cut a piece of cable
to a certain length and short it at the end to kill the frequency of said
wavelength. Something like this...

```
|<------------feed line cable length important??--------->|

-----------------------------------------------------------
Antenna -------------------------------+--------------------------- Receiver
----------------------------+ | +-------------------------
^ | | | \
| | | | \
The length of this | | | | \___location of BNC "T" connector
"stub" is cut to the | | | | important??
wavelength of the | | | |
offending frequency | | | |
v |_|_| <---Short center conductor to shield
```

The pager frequency is 152.4 Mhz. So using the ol' ARRL handbook I get a
wavelength of 1.96 meters (length of the "stub").

Has anyone heard of this before? I know it's cheap and dirty, but I'm not sure
if the location of the "T" along the feedline is important. There's no mention
of this kind of filter in the handbook, but I'm sure I've seen it before.

Thanks in advance for your input.

Most police radar operates on a doppler-shift principal. That is the
reflected signal is shifted due to the relative motion between the
source and the reflecting object. The train whistle rising in frequency
as it approaches and failing in frequency as it leaves is a audio
example of what happens. The difference in frequency between the transmitted
signal and the recieved signal does fall into the audio band. It would
be posssible for the audio portion of the gun to be suseptable to RFI,
much like a stereo, I supose. But getting Johnny to cooperate in a test
will be another matter. Good luck!

From: rc@cmr.ncsl.nist.gov
Message-ID: <8907192238.AA04103@cmr.ncsl.nist.gov>
Source record: 17916

How about forgetting no-code (at least after the ARRL Board Meeting, and
until something happens at the FCC(and consider the likely coming of a
fee of $30 for each FCC amateur license action: license appl, change of
class, change of address, etc.

Dispite my position on no-code (guess), perhaps a modest license fee is a
better way to judge interest and/or dedication. It certainly would be if
we had an annual license fee in the $30-50 region as a LOT of countries do.

Matbe we should beat THIS dead horse for a while, since I doubt if many minds
have been changed by the sophomoric or foaming arguments which seem to char-
acterize the "other" question.

wat sa?

As is the case here, too. I guess the CW exam is not acting as the filter
it was designed to be. Oops, it wasn't designed to be a filter; some are
just trying to make me think it was. I almost fell for it.

> during the middle of an HF contest and point the finger accusingly at the

Also, with economic, population, and technical growth, overall demand and
use of ALL SPECTRUM has drastically increased. But has ham radio made a
cooresponding increase? It certainly has not, and that is because some
people are trying to keep it out of ham radio, probably so that ham radio
will continue to be the hobby they knew it as when they first got their
license.

> Think about it...

This is something we really should do.

However, there are still some things we do have to argue better in the future, and make the FCC staff (and those in other services) understand. That is that the mere fact that a band segments SOUNDS DEAD does not mean it is unused, can be shared, or its uses can be easily moved to another frequency. Weak signal DX has no parallel in any other services. We need to find a way to justify having this kind of operation, and justify preserving a frequency spectrum for it.

> concerned; it doesn't work. And please don't speak for groups to whom
> you don't belong. Thank you. 73, and please join us (on CW) above 902.

I was not talking exclusively about WEAK SIGNAL and DX work on the VHF-EHF bands. I was talking about people who do (or want to but can't) experimental projects on those bands. One does NOT have to be interested in doing DX work to be interested in building a better antenna. While SSB, FM, and even ATV will not have the range CW has, they are themselves very challenging, and can serve quite well as the testing basis for the experiments in antenna design and construction. The same goes with any other aspects of experimentation.

From: waters@dover.sps.mot.com
> You make a good case for needing CW, but not for needing a CW TEST!

Mike sums this up very well. In fact, you will probably do better when the CW you use is very very slow. You don't need to be a skilled CW operator to send and receive at a slow enough rate that you can look it all up on a code table.

But not everyone will even want to do that anyway.

From: waters@dover.sps.mot.com
> Learning CW is only one of a great many skills you need to succeed at that
> kind of experimentation, probably one of the more easily acquired ones too.
> The others (like adjusting receiver front ends for low noise figure) you
> learned because you HAD to, not because of any test.

Gee, Mike, maybe we should add that to the Advanced and Extra exams. :-)

From: waters@dover.sps.mot.com
> The proposal is not to discard CW or even to restrict CW in any way, the
> proposal is to drop the TEST and only the test. If indeed CW is useful then
> hams will learn it for the same reason hams have learned every other skill
> needed to operate - because it is needed, not because it is "traditional".

Well Mike, actually some might very want to learn it because it is "traditional", but we certain agree that we should not force CW down the mouth of new hams just because it is "traditional".

> for ham radio do you see on the bands now, even from those who are
> supposedly earning their licenses?

You probably do have the wrong impression. I'm sure those "no-coders" for whom CW comes easy did not have to work quite as hard as you. Where your impression is wrong, however, is that we are "hasty in desire to turn us into CBers". This is absolutely incorrect. I can see how many people like you might get that impression when some people are posting messages saying that removing the code requirement from the Technician class amounts to having no test at all. Those people are, of course, misleading you. There are also some insane proposals floating around. I suggest you read one that makes more sense, and discard the insane ones as the FCC will do early on.

> Explain to me why it makes sense to throw away our only claim to fame and
> spectrum... the fact we have to earn our licenses. I must be getting old,

That is NOT our "claim to fame and spectrum". The fact that hams prove that they know CW, radio theory, and radio regulations does NOT entitle the Amateur Radio Service to any spectrum allocation. The fact that we provide public benefit in accordance with 47 CFR 97.1 (47 CFR is regulatory lingo for FCC rules) is what entitles us to spectrum. The fact that we are not growing in our effort to do this public benefit is why we are losing our spectrum to others who are claiming their benefit to the public is greater.

> but it is hard for me to understand how it helps ham radio to throw away
> the one thing that separates us from the CBers. I will never work ATV, but
> I sure had to study it to pass the Extra. Let's do away with those exam

No one is proposing to delete CW from the Extra exam, either. However, I might see justification for a license class just for people who want to only work DX using CW, *IF* it can be shown how that license class will benefit the public under 97.1.

> questions, since they are unfair to anyone not wanting to study ATV. I
> do not plan on operating any FM, so I should be exempt from any questions

> regarding FM. In other words, where do we draw the line? How about a
> beginner's no-theory license, so they can learn theory by doing (sure).

It is not necessary to be "doing" to learn theory.

> So, explain to me why.

Why? Why not?

...

It was not my intent to initiate "HRO bashing". I have never dealt with them before, preferring dealers within drivable distance of where I live. I only stated that because of the political position taken by HRO, I will exercise my political position by not making any purchases from them in the future, as unlikely as that is to have occurred. However, if any of the dealers I deal with also make statements of being against a position I am for, then I will stop buying from them as well.

1648. Modifications for Pro-2004 - Compiled

Newsgroup: rec.ham-radio
Date: 1989-07-19 23:48:35 UTC
From: mholtz@sactoh0
Message-ID: <1624@sactoh0>
Source record: 17922

Welcome, welcome all to the

Complete Radio Shack Pro-2004 Mods file
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Compiled from postings on rec.ham-radio
and other sources available

Some brief notes before we start. . . .

In response to numerous inquiries I am posting a overview of the mods to the Radio Shack PRO-2004 scanner. First, all mods are done at your own risk. I assume no responsibility. I do not know what effect they (the mods) will have on any warranty, however I would think they would probably void it. Also, one of the mods restores coverage of the cellular phone frequencies. It is ILLEGAL TO LISTEN TO CONVERSATIONS IN THIS BAND!

A> Read the following statement 1,000 times over

First treat the radio as if it were CMOS, that is make sure you and it have no built up static charges. UNPLUG THE RADIO FROM THE AC OR DC POWER SOURCE AND ANTENNA!!!!!!!! Be sure to handle the sub-assembly board and cable connector CN-501 with TLC, since even the slightest damage or minor crack in the board will result in a scanner good for use as a boat anchor.

B> Before doing anything else . . .

Take the radio out of the case by removing the 4 screws on the back. Carefully invert the radio.

C> Lets wrangle with a few diodes

Locate a box-like sub-circuit. It's near the switch marked "restart". The sub-circuit should be marked PC-3. Carefully pry off the cover of the metal box. Inside there will be a 64 pin dip IC. This is the radio CPU. Be careful not to touch or short out any leads on the chip.

The following diodes will determine how your scanner will work.

D-510 in circuit - scanner will have 400 memories (10 x 40)
removed - scanner will have 300 memories (10 x 30)

D-512 in circuit - it will step 30kHz from 825-844.995 and 870-889.995
removed - it will step 12.5kHz from 825-844.995 and 870-889.995

D-513 in circuit - will not scan 825-844.995 MHz or 870-889.995 MHz
removed - will scan all of 800 MHz band

D-514 in circuit - scanning rate increases to 20 channels per second
removed - scanning rate in 16 ch/sec (alt 8 ch/sec)
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

!!!! WATCH POLARITY !!!! If you cannot find a location, count backwards from a known location.

D> Turbo Scan-Another way

Turbo scan for the 2004??? Yes!! Someone has realized that if you replace the present 7.37 MHz ceramic resonator CX501, with a 10.7 MHz ceramic resonator it really boosts the scan/search speed! The present resonator is soldered between pins 29 and 30 of the CPU (IC-503). Rumor has it that a 10.00 MHz computer xtal will work just fine.

Jacque (KA9FJS) confirms that the mod works with an ordinary 10 MHz computer crystal ($1 at hamfest) but reports a possibly-undesirable side effect: Increasing the clock rate _decreases_ the resume-scan delay time. Jacque says: "The manual says delay is 2 seconds; with mod, delay is <1 second. Painful if

a channel is filled with slow responders." He reports no detection problems at the increased scan rate.

E> The Squelch Mod

Now, locate a sub-circuit box under the sloping front panel. It should have many alignment holes in the top. Pry the cover off very carefully. Locate IC-2 in the left side of the pc board. It should be marked IC-10420. Locate R-148, a 47 K ohm resistor between pins 12 and 13. Cut a lead of this resistor, But be sure to leave enough lead on both sides of the cut to solder to. Patch in a 100K ohm resistor. Make sure there are no solder balls or short circuits. Now your squelch will operate more smoothly.

F> The S-meter mod that doesn't work

1 - Locate transistor Q-9 (far front right area of the radio, just under the sloaping front panel.

2 - Drill a 1/4" hole in the rear chassis of the radio.

3 - Install a RCA jack in this hole.

4 - Install on lead of a .10-uF ceramic disc capacitor to the center lug of the RCA jack and the other lead to ground lug of the RCA jack

5 - Clip off all but 1/4" of leads of a 10-K ohm resistor. Carefully, solder one lead to the collector (center lead) of Q-9. PRETIN ALL LEADS AND USE A LOW WATT IRON WITH SHARP TIP!!!

6 - Solder a 12" wire to the free end of the 10-K resistor. Slip a 1" section of insulated tubing over resistor and wire to prevent shorting.

7 - Connect free end of the wire to the center lug of the RCA jack.

8 - Connect a voltmeter capable of reading between 1 and 3 volts, DC (digital or analog to a RCA plug. Red wire to center, and black wire to the shell. Shielding in not needed.

Connecting the RCA jack and plug will now give you a measurement of the receivers intermediate frequency automatic gain control (IF AGC) the author

said the range will be between +1.87 volts DC with no signals present to +2.6 volts DC for a strong signal. He also suggested that a digital voltmeter with 2 or three decimal places gave better resolution.

Brace yourself for disappointment - the integrated circuit mentioned for the S-Meter modifaction is used for WBFM only. Despite the internal IC block diagram in the service manual, pin 10 on my PRO-2004 is useful as an S-meter output only when the radio is in the WBFM mode.

Between pin 10 and ground, I placed a 10,000 ohm resistor in series with a 250 microamp meter for a simple test setup. The meter read full scale on strong signals. With no signal at all, the meter read about 70% of full scale. When the mode is set to AM or NBFM, the meter was always at zero.

One could add a bridge circuit here, but this metering point is of limited utility.

G> A carrier operated light

With a room full of functioning scanners, it's difficult to determine quickly which radio is "talking." I use separate external speakers on each radio, and the spatial separation helps.

In addition to "hearing" which radio is active, I like to "see" which radio is active, and carrier operated lights are effective at providing such visual cues. The idea is to illuminate a lamp when a signal opens the squelch. A small yellow light emitting diode (LED, another Bell Labs invention) is well suited to this purpose. The following modification works well on all PRO-2004 modes.

To add a COR light to the PRO-2004, make use of the "scan control" pin (pin 13) on IC2, the TK10420 IC. Pin 13 has voltage present only when a signal is detected. This chip contains the IF, detector, limiter, and squelch circuits for NBFM.

If you tremble with an electric drill in your hands, read no further. The LED can be mounted in a small hole drilled through the plastic front panel, just to the right of the headphone jack.

Electronically, the circuit is simple. The voltage at pin 13 is not enough to drive the LED directly, so a general purpose NPN transistor (e.g., a 2N2222) can be used as a solid state switch.

- Pin 13 of IC2 is connected to the transistor base through a 10,000 ohm resistor.

- The emitter is grounded.

- The collector is connected through a 1000 ohm resistor to one end of an LED. This resistor limits the LED current to about 13 milliamps.

- The other end of the LED is connected to one contact on the rear of the PRO-2004's on/off, volume control. This furnishes about 14 VDC unregulated to the circuit. The back of the on/off switch has two contacts. Use the one

with the brown wire connected to it, as this contact is only "live" when the scanner is turned on.

I mounted the 2 resistors and transistor on a small PC board, which I fastened to the PRO-2004 chassis using a metal standoff.

H> A Tape Relay

This mod works on the same principle: you use the same pin (13?) on the IC that you normally use for the carrier detect light, but instead of a light being used, I used a small low-current relay. Connect the primaries of the relay in place of the light. You will have to determine the proper resistance to wire in series, if necessary. Then connect the secondaries to the tape recorder's "remote" jack. Depending on your tape recorder, you may need a normally-open relay or a normally-closed. For mine, I used a very small normally-open relay that draws about 50 ma at 12VDC that I got from one of the mail order houses (Jameco, I think).

By the way, I have both the relay and the LED hooked up. I use the 2N2222 as the solid-state switch for the circuit. I also put diodes in line coming from the IC to the base of the transistor as well as one coming into the collector of the transistor just for safety sake.

I> Finally. . . .

Make sure you re-install the metal cover and re-install the radio in the case!!!!!!!!!!!!!!!!

For what it's worth, my experiences with Ham Radio Outlet have been almost perfect. I have dealt with their Oakland and Burlingame stores. They swapped out an HT on the spot, with no questions, after the final fried. I was misinformed by them on one occasion (about mounting hardware supplied with an antenna) but I am under the impression that it was WELL within the margin of error for a competent person sincerely doing a job.

Sorry to hear others haven't been so fortunate.

A friend of mine just purchased a new TM701A dual-band rig.
He is a MARS member and would like to use this rig for that purpose;
that is the main reason that he bought this rig.
Our local dealer/service center does not have the mods for this radio.
Can any one help?

If you wish reply via electronic mail.

Therein lies my argument for keeping the code test - dedication. We do
not need those unwilling to put some effort into becoming a ham.

1653. Re: 2m Transmision Affect Police Radar??????

There are many possibilities. You need to explain fully the situation though. Where was he in relation to the radar, what speed did he claim he was going, what was the traffic around him doing, etc. I was driving on I35 in Oklahoma when me and another car (with radar detectors) hit the brakes at the same time. Meanwhile the "naked" car in the middle kept on going (we were all doing about 70). The state trooper went after him like a fly towards ****. We need tax and fine dollars in Oklahoma, but I'm an Oregon resident thank you... I try to keep from contributing to their Revenue Enhancement Projects. By the way, the visual effect of two cars pulling back, and one car pulling forward is enough to convict an old lady...

1654. Autopatching. A brief explaination sought.

Gentlemen,

Could somebody either key in, or point me towards, an explaination of the fundamentals of these "autopatch" things. I know it works by having a repeater connected to the phone system, but how is it accessed? Who gets charged for the calls? How do you stop people calling Uncle Jim in Australia? etc., etc., etc.

The rules in the UK (and probably Europe) are much simpler. It ain't allowed. That's why I don't know anything about it!

Also, I have the ARRL repeater handbook (because I visit the US occasionally). Some repeaters are described as "private". What does that mean? In the UK all repeaters are open access (although you might have trouble shouldering aside the local clique!).

73, Hugh, G0CNR.

1655. Re: 2m Transmision Affect Police Radar??????

Source record: 17929

On my radar units, if I hold my HT in front of the antenna within 50 feet or so and transmit, I hear my voice come out the doppler speaker on the radar. I won't even risk a guess as to the demodulation mechanism but suffice to say that radar units receive 2 meter FM very well.

As to proving it in court, it is easy. Simply supoena (sp) the radar gun in question. You must supply a power supply with a cigarette lighter plug. Then demonstrate the reception capability. If you can raise even a squawk from the unit, and you otherwise sound credable, of course, you have raised a reasonable doubt.

For those of you in states that call speeding tickets administrative violations and thereby deny you due process, well.... The South's an awful nice place to live :-)

You mean to say that we should not "rock the boat" for fear of getting them
mad ?? So we are supposed to give in and let them do whatever they want
even though the band use documentation that they used to make their case
was, BY THEIR OWN ADDMISSION, severely faulted ??? And the spectrum that
they want to take is not really needed ??? !

BTW, the commission often will do an "end run". It is much more normal
than them following their own rules ! Ask any communications lawyer
>
> I believe us to be viewed in a bad enough light as it is. I have no inside

>
> Why is this? Many reasons. Usually our archaic practice of hazing new members
> with CW is mentioned.

Why do people wrinkle their noses when you tell them that you are a ham?
Because by and large hams are perceived to be a group of NERDY type people
who sit in rooms with big racks of radio gear yelling 10-4 GOOD BUDDY
I GOT A COPY ON YOU, and interfearing with your neighbors TV, especially
sunday afternoon (or monday night) football ! That's right, the public
generally cannot tell the difference between a CB'er and a HAM.
Amateur Radio has an image problem which can only be solved by a good
public relations campaign. There are many people who don't know we (amateur
radio) even exist. You want to fill the ranks with new blood ?? Then
hire a professional public relations firm who's profession and livelyhood
is earned by getting the word out. You will generate more interest in
ham radio this way then you will by comming up with a no-code license.

As large a factor, I suspect, is the fact that
> ham radio contributes little to society any more. Whether it be technical
> innovation or emergency services or whatever, we lag many other segments
> of society. Occasionaly some segment of ham radio produces something
> significant; for instance, the HamSat program is poineering cheap sattelites.

> commercial, we're hobby" you might say. True, but that has no effect
> on the value of our specturm.
>

Once again, we need to get the word out when we do something worth
while. If your group helps with a walk-a-thon then get a news blurb in
the local paper/tv station/radio station. Get your local officials
involved and informed.

> Some (much?) of our failings are our fault, others are a result of the

> how hard it is to move to 900 meg or 10 gig or whatever and the reasons
> we give are laughable to the commercial side (real to us, of course).
>

You must be careful when you say unused. The 220 spectrum in the range
that they want to abscond with is NOT unused especially in the Metro
areas where they claim that this land mobile expansion slot is needed.
The other point is that they ALREADY HAVE spectrum available in this
frequency range which is PRESENTLY UNUSED, that being the in-land
water-ways frequencies. Why can't the land mobile service share the

215-220 band ? The clintcher is that 215 to 220 is an IN LAND ie.
Mississippi River) band and the spectrum that they claim they
need is ON THE EAST and WEST COAST, a thousand miles away !!!!

2 MHz is not a tiny chunk. Also, the FCC should not be in the BUISSNESS of
radio rather the science of radio. You cannot compare 10 GHz with 220 for
propagation and ease of equipment construction.

> Then to top all this off, when the FCC starts an initiative to modernize
> the service and drop CW, we again cry like babies. So where do you think
> we stand with the FCC?
>
You must be careful again. What is your idea of moderization, no-code ?
No-code is not modernization as can be seen by the move BACK to CW by the
military for it spectrum efficiency, and jam resistance. No-code is just
change for change sake. It seems more and more like a bunch of the
"Gimme" generation or the "I got a right" generation. They are afraid
of a little work. After all why work for something when a when I
can whine enough and someone will give it to me.

> I think that if we win the 220 battle, we will have won a fight and lost the
> war. I think we should concede this one and work on cleaning our act up a bit.
> Maybe then we can justify holding on to the next chunk that comes under fire.
> All this current fight is going to do is make the other side sharpen up its
> tactics a bit.
>
Once again you want to give in to this agency just to avoid getting someone
angry. It might not be so bad if there was a real need for the spectrum
BUT there ISN't. Just when do you think we should fight ? When they try to
impinge on the 2 meter trash band ? Should we fight then ? Or how about if
they want to re-assign 20 meters to the forrestry products people or NMR ?
Just when is the right time ?

> Think about it...

No, but it was costing some small amount of money to receive, store, and
analyze the data.

FYI, from PR Docket No. 88-139 (revision 47 C.F.R. Part 97) Appendix 3 - Glossary of Terms: "Business Communications. Any transmission or communication the purpose of which is to facilitate the regular business or commercial affairs of any party."
I don't see where this definition leaves too much room for inter-pretation as to the legality of a call to the local pizza parlor on the autopatch. It reads ILLEGAL to me.
IMHO, a "party" would be construed (no, I'm not a lawyer) as one involved in the actual transmission or communication. Following that line of reasoning (possibly dangerous) it would seem that a call on the autopatch (or a call on the air) to someone with access to a land line would be legal since neither "party" is involved in the business of selling pizza.
Just an amateur interpreting the rules as I read them.

I started working at a NASA tracking station shortly after ALSEP was
shut down. The story I heard was that NASA ran out of money to receive,
record and process the telemetry data. The tracking stations used to
record ALSEP data for hours at a time, every day. I was also told that
NASA had warehouses full of magnetic tape that couldn't be reduced or
analyzed due to lack of funding.

Message-ID: <8907210806.AA07959@ucbvax.Berkeley.EDU>
Source record: 17940

As I read the ARRL bulletin regarding the proposed renewal fee for
Amateur licenses, it seems to me that the fee would be imposed at the
time of application and renewal - every 10 years!. (I do realize it also
it includes charging for modification and reciprocal permits.) As far as
paying $30 every ten years to keep my license, I think I could find the
dough somewhere.
I'm still struggling with the argument about whether or not this move
would set an unwelcome precedent. We could see the sky as the limit
in fees charged to a service which CANNOT operate with any pecuniary
interest.
Just wondering if others forsee the RENEWAL fee as an annual one or
one due only upon the current license expiration schedule (10 years).
Some may say we are worrying about something that has not happened yet,
I say we've got to keep a sharp lookout on all proposed FCC actions.

> is there a possiblity that the RF signal interferred with the radar gun?
>
> Anyone have any theories?
>
> Dave Colvin VE3ZDC
> for VE3OVO.

I don't know about this. I did some figuring, and the 73rd harmonic
of 145 MHz is 10585, right in the middle of the X-band police radar
band. Also, the 168th (!) harmonic of 145 is 24360, right in the middle
of the K-band police radar segment. However, if your friend is
radiating ANY significant energy at either the 73rd or 168th harmonic,
I would think he'd be getting hate mail from the DOC for interference
on the 2nd, 3rd, 4th, etc, where the radiated energy would be much
greater anyway.

I CAN activate my Escort in my car on X-band when I transmit on 2m.
Not always, and only on X-band, and only when I run a couple hundred
Watts output. The Escort front end is probably pretty wide, though, so
it doesn't really surprise me that this can happen. I would hope the
police radar units' receivers would be at least slightly more
selective.

Bottom line, at least from my perspective, is that there might be
another factor- he probably really was speeding, even if he didn't
realize it (as you mentioned, tires, speedo error, etc.).

I'm afraid that's not much help, but it's all I could come up with.

1668. Proposal: An Alternative Licensing Method (RE: NO-CODE)

Newsgroup: rec.ham-radio
Date: 1989-07-20 21:01:50 UTC
From: pfluegerm@gtephxgtephx.UUCP
Message-ID: <448a0c2c.15840@gtephx.UUCP>
Source record: 17942

Why all the fuss over no-code? How about maybe-code: you only get tested on it if you want the corresponding privileges. In fact, why not expand that idea to the whole licensing and privilege structure. It may even help bring in a lot of new hams while keeping the "quality level" high.

That's my idea/proposal: why not just grant a basic ham license on rules, regs, and some basic theory, then have "endorsements" for certain other modes of operation? Privileges would be tied (to some degree) to frequency allocation for that endorsement. The basic license would allow for limited capabilities of ALL modes/specialties. This would be similar to getting a pilots license (i.e. you can fly single-engine VFR in the daytime, but need endorsements for IFR, multi-engine, etc.).

BASIC LICENSE:

Demonstrate knowledge of rules & regs, frequency allocations, some basic applied radio and electronic theory, procedures. Gets you say 50-80% of all voice privileges (bands/frequencies) on HF and VHF/UHF. Allows very restricted but *REPrepresentative* use of other "special" modes (CW, digital, microwave, satellite/space, etc.) to get a "flavor" of and experience with the other capabilities. The basic license theory would *touch on* theory and procedures for these other modes. MUST know how a repeater works (my pet peeve) :) This should be roughly equivalent to today's General theory in difficulty and scope, but modernized and maybe more representative of actual knowledge, not memorization skills.

ENDORSEMENTS (examples):

Each endorsement permits additional privileges, including frequencies, for hams who have demonstrated detailed knowledge of rules, regs, PROCEDURES, and knowledge of APPLIED, modern theory in these areas. You can get any mix of endorsements you desire (or none!). Each could have one or more levels of proficiency with a corresponding increase in related privileges.

- CW: Demonstrate capability to send and receive morse - we'll stick with the current 3 levels, 5, 13, & 20wpm, each level giving additional frequency allocations. Basic license would allow CW experimentation, even though working knowledge of CW is not required (only theory of how it works).

- Digital: Demonstrate knowledge of computers and digital modes (RTTY, packet, etc.). Have at least 2 levels, one for slow speed (RTTY, packet, etc.) one for high speed (future digital audio, digital video).

- Microwave: demonstrate knowledge of microwave theory for privileges in these bands.

- Satellite/space: demonstrate knowledge of VHF/UHF theory and satellite/space (e.g. EME) procedures for privileges in these bands.

- Repeater/Remote Base: This endorsement is required before allowing a ham to put a repeater or remote base on the air. Also required is the applicable "Specialist" licenses for the band and mode where the repeater will be operated (e.g. a 2M packet repeater requires both the VHF/UHF specialist and Digital endorsements).

- VHF/UHF Specialist: Demonstrate knowledge of VHF/UHF theory, repeaters, procedures, etc. Gives additional frequency/band/mode privileges.

- Video: SSTV & FSTV privileges.

- Voice Specialist: Demonstrate additional knowledge of radio/electronic theory and procedures to get additional voice privileges HF/VHF/UHF, some microwave.

- Experimenter: demonstrate excellent knowledge of current electronic theory and applications. Allows experimentation with *ANY* new modes on restricted bands and frequencies (e.g. spread spectrum, channel hopping, digital audio/video)

- Pizza: this endorsement allows you to order pizza on the autopatch. (Just kidding on this one :)

CURRENT HAMS: current hams would be "grandfathered" so as to roughly keep similar privileges to what we have today. Every ham would be "upgraded" to the Basic License", and would receive the endorsements to get back to roughly their current level of privileges (e.g. current "General" class would get 13 wpm CW endorsement, and the lowest level of all other endorsements).

I'm sure there are other endorsements, other requirements. It needs to be fleshed out (I just thought of the concept and jotted down some ideas). So please, no flames on the details, only the concept :)

I think this idea has a lot of merit and would like to see some constructive discussion about it on the net (or anywhere else). Maybe this is a better way to go, maybe it isn't. I'd like to generate some ideas and move things in a CONSTRUCTIVE direction, not just have a code vs. no-code fight.

I *do* think that this might help bring in a lot of new hams. It sort of advertises what all you can do on ham radio, and you only have to know/learn/be-tested-on those points which are really applicable.

1669. Re: 2m Transmision Affect Police Radar??????

Newsgroup: rec.ham-radio
Date: 1989-07-20 21:34:47 UTC
From: karn@jupiter
Message-ID: <17252@bellcore.bellcore.com>
Source record: 17943

A little understanding of how police radar guns operate will go a long way toward explaining why they can be QRMed so easily.

A typical radar gun generates RF with a Gunn diode (or similar device) and feeds it to a small horn. In the feed is a microwave diode. This diode samples the outgoing RF and mixes it with the doppler-shifted return echo, thus producing the audio beat note that can be fed to a frequency counter calibrated to read miles per hour.

There is virtually no frequency selectivity in the receive portion of the gun other than the horn antenna and waveguide; any strong local RF field reaching the diode will interfere with the audio beat note it produces.

This technique has been exploited by active radar jammers. All you have to do is produce an RF signal that is amplitude modulated with an audio tone corresponding to the speed that you wish to appear on the cop's readout, and this signal will swamp out the beat note produced by the mixing of the transmitted and reflected radar signals. You don't even have to be on the radar's frequency (10.525 GHz in the case of X band radars). For example, you could be in the 10 GHz ham band that happens to be conveniently placed just below police radars. In the case of K-band (24 GHz) radars, the frequency in use happens to be right in the middle of the ham band (which we share).

Now, building a device whose purpose it is to jam police radar would probably still not be legal even if you are a licensed ham operating in the ham bands with legal power -- since your intent is to interfere with someone else. On the other hand, if you were to build an experimental collision avoidance radar for your car that just happens to operate in the 10 GHz ham band, it would be pretty hard to keep it from *accidentally* interfering with all those poorly designed police radars...

An even more clever device is the passive radar jammer. These work by modulating the radar cross section of the car at an audio rate determined by the operator; this frequency swamps the transmit/receive doppler beat note at the radar and confuses the frequency counter. Because you're not emitting any RF energy, you can't be accused of jamming. The only problem is that you need an antenna of a size on the order of the cross section of your car...

1672. Re: How do I make a notch filter with cable?

Newsgroup: rec.ham-radio
Date: 1989-07-20 23:22:51 UTC
From: billk@hpsad.HP.COM
Message-ID: <1530026@hpsad.HP.COM>
Source record: 17946

It is possible to make a notch filter the way suggest, but it is not incredibly narrow in frequency. Fist however, let me clear up a few points:

1. You must account for the velocity of propagation in the coax you choose. If it is standard polyethylnee, that is .66, so lambda=.66* 1.97m=1.299m.

2. You really want a half-wave stub (although a full wave would work) if you choose to use a shorted stub. (1.29/2=.65m) A quarter wave open stub would work also.

3. Put the tee right at the radio, this leaves one less variable in the system if the source and load are not close to 50 ohms.

Now for some empirical results. I just tried a 4' shorted stub of RG-58. So 48"+2"adapters/39"/m=1.28m/.66=1.94m effective *2=3.89m wavelength divided into 3e8m/s=77MHz.
This provides about a 25dB notch, but it is more than 25MHz wide at the 3dB points, and about 7.5MHz wide at the 10 dB points at a center frequency of 75 Mhz. The calculated length value came out within about an inch of the measured value (2%error), negligable with a 10% 10dB bandwidth. A larger cable (lower loss) would provide a narrower notch (higher Q) filter. I seem to remember a 6" diameter duplexer cavity easily gives ~200kHz at 2 meters. So go ahead and try it, but expect reduced sensitivity.

It has been some time since I operated on 6mSSB, but I do have some general comments on antennas and amplifiers. A very reasonable antenna is something like 6 elements on a 24' boom. Hy-gain made one once upon a time, but I'm sure someone makes something similar these days. I also had a Telrex 11 element beam on a 36' boom, and that worked quite well. I think Henry Radio still makes a power amplifier using an 8874 that should easily give 500w out. Alternately, I've seen several nice designs in the handbook over the years utilizing everything from 4cx250s to 8877s. I've used an amp made long ago by Raytrack that had a pair of 3-500zs, and it made about 800w cw, which is plenty. I don't know of anyone making anything really interesting in the transverter market, and the last time our VHF contest team (W2SZ/1) needed one, I built the LO and receive converter from scratch. We use a very old homebrew transmit converter also. Hope I've been of some small help.

1674. re: "private" repeaters

Newsgroup: rec.ham-radio
Date: 1989-07-21 04:50:00 UTC
From: CSMSCST@OAC.UCLA.EDU
Message-ID: <8907210807.AA07982@ucbvax.Berkeley.EDU>
Source record: 17948

> occasionally). Some repeaters are described as "private". What does that
> mean? In the UK all repeaters are open access (although you might have

The ARRL recognizes three classes of repeater access: Open, Closed, and Private. Open repeaters are intended for general use by all hams. Closed repeaters are intended for use by members of a radio club or other group, but membership in the club is available to all interested parties (a fee may be involved). Private repeaters are intended for use by a specific group which does not offer open membership. Perhaps the most common class is open repeater/closed autopatch, where use of the autopatch is restricted to those paying the bills, but the machine is otherwise open.

In low density and rural areas, PL (tone-coded squelch) is often used to designate closed/private repeaters. In high density urban areas such as Los Angeles, there may be multiple machines on each available channel, and the frequency coordinating committees require PL on all coordinated machines in order to limit interference. (On some 2m channels here, I can key up three machines from the same location.) In this case, you need to consult a repeater guide or ask on the air if a machine is open. Unfortunately, many manufacturers do not understand this use of PL, Kenwood (otherwise a favorite of mine) is a leading example of this.

Personally, I don't have a big problem with closed machines (as long as sufficient frequencies are available for open machines) although I would rather see open machines with closed patches. I disagree *strongly* with the concept of private machines, and have and always will decline offers to become a member of such cliques.

Several of the European contributers to this list have asked how the phone bills are handled. Toll restricters are available in all of the better commerical autopatch controllers; with a microprocessor it is simple to scan the requested phone number and make a cost decision. Disallowing calls out of the current or immediately adjacent area code is usually sufficient. Some patches only allow calls to pre-programmed numbers, which members register with the patch manager. Open autopatches are generally restricted to local calls. Closed patches use a combination

of area code restriction and peer pressure to keep costs reasonable, and patch membership fees are based on the average annual phone bill. Europeans should keep in mind that US and Canadian toll costs are considerably less that those in Europe, where the telephone companies (PTT's) are government monopolies.

Source record: 17949

> Glossary of Terms: "Business Communications. Any transmission or
> communication the purpose of which is to facilitate the regular business
> or commercial affairs of any party."

Seems to me that when I buy a pizza, they don't give it to me -- I have to pay them for it. There are two parties conducting business here, one a vendor, the other a consumer. Clearly, ordering a pizza is conducting a commerical transaction. Asking a third party over a patch to conduct business on my behalf is "facilitating my commerical affairs."

I am not advocating such a strict interpretation of the regs, nor do I believe the radio police will arrest me if I ask someone to pick up a quart of milk on the way home. However, what I wish the rules said is one thing; what they currenly do say is extremely restrictive, and IMHO, very clear.

Could someone append whatever statement the CB rules make regarding permissable communications in that service.

Here's a question I've always wanted to ask: why even bother to shut the
things off? Just ignore them, and if they're still working a few years later
when you change your mind, so much the better. If they had shut off the
deep space network, would they have given a command to the Voyagers and
pioneers "make no further broadcasts, accept no further instructions from
Earth"?

Here is a reposting of the mod to extend the receive range of the new
Yaesu dual band handie to 130 - 180:

1. Turn radio OFF.
2. Hold down both UP and DOWN arrows.
3. Turn radio back ON.

Thats all there is to it!

Have had no responses to my posting for additional mods but will post anything
I do get.

From: ppddc@uwocc1.uwo.ca
Message-ID: <0617018292@uwovax.uwo.ca>
Source record: 17952

Thanks to all those who have replied to my posting on 2m radio interference with police radar.

On a related topic, the Ontario Provincial Police became the first on the continent (according to them) to put a device into service that detects radar detectors. Apparently it senses the microwave signal the fuzzbusters produce from up to a mile away. (It is illegal to possess a unit in Ontario.) They seized 180 units in 60 hours in Toronto. Sounds like a good revenue producer!

My anti-radar unit works well and is totally legal--it's called cruise control.

Dave Colvin VE3ZDC

The present code and theory tests are not designed to test whether someone will be able to be a good ham. They are simply hoops to jump through. Hence, if an otherwise qualified person (for my definition, see my last posting) stumbles on one of these hoops, their entrance into amateur radio is delayed as is their on-the-air contact with hams. This impedes their apprenticeship with gurus.

> not need those unwilling to put some effort into becoming a ham.

Dedication is something that is engendered by interest in a hobby over time, not something that is rammed down one's throat by a test requirement. As I indicated in my previous posting, most useful skills are developed after a ham becomes licensed, with the help of more experienced hams. The code test does nothing to aid in training hams with either on-the-air etiquette or with in-the-workshop savvy---it exists only as a tool for hazing. I take a free-market approach to code: if someone has interest in CW (presumably because they have witnessed more-experienced hams enjoying it), they will develop the skill, just as they would for any other amateur mode.

Just out of curiosity, why do people want to know what new call signs have just been issued? About the only reason I can think of to want to get info on new hams is to put them on a commercial mailing list or to solicit them for memebership in a ham club. Having just the call sign isn't much good for this; you'd want name & address info instead, or in addition. I get the impression people asking about this subject are just looking for the call sign by itself, and I can't figure out why they care about that...

Regards, Will

In article <17252@bellcore.bellcore.com> karn@jupiter.bellcore.com (Phil R. Karn) writes:
>This technique has been exploited by active radar jammers. All you have
>to do is produce an RF signal that is amplitude modulated with an audio
>tone corresponding to the speed that you wish to appear on the cop's
>readout, and this signal will swamp out the beat note produced by the
>mixing of the transmitted and reflected radar signals.

I remember reading several years ago about someone who had actually done this
and it worked like a charm. In fact, it worked too good. He had it set to
read out exactly 55 mph. Once, when he got off the interstate, he forgot
to turn it off and got pulled for doing 55 in a 35 mph zone. And how could
he explain that to the cop?

PS: To answer the original poster's query, I believe that the ARRL has a packet
it will send to amateurs who believe they are the victims of RFI in radar
guns. I have never seen it, but I think it lists successfully defended
court cases, and suggestions for a defense, slated for American courts, no
doubt. You may want to call and ask about it.

>class, change of address, etc.
>

I could support a license fee if it is reasonable, depending on how the funds are to be used. I could tolerate 30 bux. The big issue to me is the application of the money. If the fee is to go into the FCC's general fund, I'm opposed. I believe that if the government decides something should be regulated (it has), it should foot the administrative bill for said regulations (it does now).

Instead of debating the fee, perhaps we should look at how we could use a revenue stream to benefit the service. Areas of specific interest to me are licensing and enforcement.

I could support the VEs making a profit on the testing. It would become much easier to take a test if you did not have to bother someone to volunteer his or her time. Of course, I'd preserve the volunteer VEs but a paid, profit making system might work too, especially for those of us who would like to schedule an upgrade exam at our convenience.

I could also support a quasi-governmental body to assist hams in enforcing the rules and prosecuting gross violators. No, I don't mean the ARRL brown shirts (OO). What I envision is a group of professionals who would advise local bodies, assist in paperwork for enforcement and finally, initiate governmental enforcement when volunteer efforts fail. A body like this should be able, for example, to rapidly put an end to the NYC taxi cab problem, either thru phone calls, letters, on up to fines and injuctions. If actual legal enforcement became necessary, the offender should have to bear the cost of process. My model for this is the American Arbitration Association.

I think this issue is worthy of some discussion and debate. I'd fight any proposal that was defacto, a tax. If we and the government could both benefit from a fee, then by all means, let's do it.

1685. Police Radar Interference

Newsgroup: rec.ham-radio
Date: 1989-07-21 18:08:12 UTC
From: AXVSCCN@UICVMC.BITNET
Message-ID: <8907220705.AA20697@ucbvax.Berkeley.EDU>
Source record: 17959

I posted something about this several months ago but I'll repeat my
comments for the sake of this recent discussion. Police radar is not
perfect. Older units can be effected by RFI --the newer ones have an RFI
detector that disables the radar in the presence of a strong RFI source.
The biggest problem is operator error which can include:

1 Little or no training with the radar and on radar theory
2 Failure to properly check-out the unit before each patrol shift
3 Misinterpretation of readings
a) Failure to recognize a false signal (RFI)
b) Failure to identify the proper vehicle (multi-vehicle situation)
c) Failure to control for possible reflection/skip

While it is possible that a 2m rig could interfere with a police officer's
radar, most radar units do a minimum of 5 samplings before displaying a speed.
A voice modulated signal would probably vary too much for the radar to
lock up on unless you were humming a solid note. You also must be fairly
close to the radar unit to effect it (in most cases).

If you have the time and the money, hire a lawyer and see if you can
fight the ticket. I'll warn you now, most municipalities feel pretty
confident about using police radar. People use the "interference approach"
to try getting out of a ticket all the time and some judges won't even bother
listening to such complaints. If you *really* feel that your 2m rig did
result in a false reading, then it's your responsibility to convince your
local prosecutor that this is what happened. You might try to arange a
test demonstration. If your 2m rig *did* cause the interference, don't be
surprised if the local cops try to charge you with obstruction. 73 ?

1686. Code fables

Newsgroup: rec.ham-radio
Date: 1989-07-21 18:25:03 UTC
From: "Mike Jordan G4ASQ"@UCBVAX.BERKELEY.EDU
Message-ID: <8907220705.AA20655@ucbvax.Berkeley.EDU>
Source record: 17960

I'd like to comment on the Code-Nocode wars from my prespective
as a U.K. ham license holder, living the U.S. for over ten years now.

I passed my U.K. 12 wpm Code test at the age of 16, after about 4
months solid effort, and daily practice with another kid who was also
going for his call. The theory was no problem and we both got Class A
(unrestricted) callsigns, breathed a sigh of relief, and used our Morse
keys as footswitches (kick-to-talk) thereafter.

Now I'm over here, I'm trying to find a way to get back into the
hobby. I've had a few reciprocal licenses, but found them very
frustrating, as the U.S. HF phone bands don't overlap with the U.K.
bands on 80m & 40m, so I can't use them at all. In general the
restrictions on use are so different in the 2 countries that if you
try to obey both rules (as required by the reciprocal permit) there's
not a lot left you can do...

So, I thought, I'll get a U.S. call, can't be too hard surely....
Boy was I wrong! Passing a 12wpm code test with the letters & numbers
separate and no punctuation when you're 16 is MUCH easier than trying
to do 13wpm with mixed modes when you're 35 with a full time job and
other responsibilities.

I keep seeing comments on the net about '5 wpm is no hurdle' - and I
would agree, especially a 'Farnsworth' 5wpm.
BUT all that buys you is the right to use CW - the ONE THING you're
having trouble with. If what you want is hf phone, then you have to get
up to 13wpm. If you want the full phone bands you need even faster cw.
So, if you want to use cw you only need 5 wpm. If you DON'T want to
use cw, you need at least 13wpm.
(This kind of logic says that if you want to drive a 4-cyl automatic,
you must pass a test on a modern stick shift, to drive an 8-cyl auto,
you have to pass a test on a 30s Bentley with a 'crash' gearbox...)

Why not keep a morse requirement, but set the speed at 5 wpm for a
General? That should please the code-or-death people, since everyone
would be able to copy their favorite mode. It would also satisfy the
international requirements (no speed specified). People with a desire
to be a ham could probably learn it in a couple of weeks. Those who
used it on the air would become more proficient with practice, those
who didn't like it might still try it to work that weak DX station.

My other question is: if cw is such a bandwidth-efficient mode, than
why is half the space from 80-15m reserved for cw only? Even if
half the contacts were cw, at 300Hz vs 3kHz, they should be allotted
one tenth the spectrum! I must admit, I don't really see why cw should

have legally reserved spectrum at all - we managed quite nicely with a voluntary bandplan, and I never heard complaints from the cw-ers in my local ham club about QRM problems.

At least there's 10m phone..........

73s Mike

>areas where they claim that this land mobile expansion slot is needed.

It's not what I say or think that matters. It's what the regulators and
politicians think. If a monitoring station cannot hear activity, it IS
empty to them. More to the point, even our crowded bands are "unused" compared
to most of the commercial bands. PL, digital squelch, trunking systems,
vestigal sideband, community repeaters and other technologies in common
commercial use make MUCH better use of the available spectrum than do we.

Hell, hams scream like stuck hogs at even the mention of PL anywhere other
than the west coast (Don't waste bandwidth giving me an example of
some repeater in bumf*ck kansas that has PL. Most don't). When the
regulators look at a) how much spectrum we have, b) how underutilized
it is in most places, c) how little REAL public service we privide
in proportion to our spectrum allocation, and d) how closed-minded the
service is toward change and/or improvements, the decision is obvious.
It then simply becomes a matter of managing the political noise for awhile.

>The other point is that they ALREADY HAVE spectrum available in this
>frequency range which is PRESENTLY UNUSED, that being the in-land
>water-ways frequencies.

That they already have spectrum "available" is not an issue. UPS can
make the very valid business argument that since the chunk of relatively

unused (definition above) spectrum is available, it should not have to
either a) develop some expensive new spectrum-conservative technology or
b) reallocate some other commercial band. They can make the point that
our use of the spectrum has no commercial value. The only counter to that
argument is a political one. And politics live and die on money and public
opinion. We have too little of either at the moment.

You can flame me all you want - this is not my opinion. It is the argument
I'd use were I on the other side and it carries a lot of merit.

>2 MHz is not a tiny chunk. Also, the FCC should not be in the BUISSNESS of
>radio rather the science of radio. You cannot compare 10 GHz with 220 for
>propagation and ease of equipment construction.

Compared to the spectrum we have, even limited to, say, below 10 ghz, the
2 mhz is trivial. WE think it is important but THEY don't.

Are you saying the FCC should ignore business concerns of spectrum
management? Are you mad? Let's try to keep that one between ourselves
lest we get laughed out of existence altogether.

Neither propagation nor ease of construction has much merit in this argument.
Commercially, propagation problems are easily addressed by relay stations.
Ease of construction, besides not being a commercial concern, is a totally
bogus argument. As most microwave enthusiasts will tell you, given the
proper tools, nice little stripline circuits using surface mount components
are vastly easier to build than big hulking HF equipment that requires
a lot of mechanical work and machining. And it's a bunch easier to build
a 30db gain antenna at 10 gig than at VHF. Tuning circuits is much easier
when you can make gross changes by adding or removing bits of trace metal.

Ease of understanding the principles involved might be an issue but if
we raise that one, we are tacitly admitting we are a bunch of dummys.
Then we have to explain our failure to train a cadre of operators or
to advance the state of the art.

>
>> Then to top all this off, when the FCC starts an initiative to modernize
>> the service and drop CW, we again cry like babies. So where do you think
>> we stand with the FCC?
>>
> You must be careful again. What is your idea of moderization, no-code ?
>No-code is not modernization as can be seen by the move BACK to CW by the
>military for it spectrum efficiency, and jam resistance.

I'd be REAL interested to see you back that one up with some facts.

No-code is just
>change for change sake. It seems more and more like a bunch of the
>"Gimme" generation or the "I got a right" generation. They are afraid
>of a little work. After all why work for something when a when I
>can whine enough and someone will give it to me.

Careful, your age is showing. There have been many fundimental changes in society in the last 20 years. Some good, some bad but all real. If you had ever tried to hire and keep talented people, you would already know about one of the more important changes. Used to, everybody conformed to the "norm" and did pretty much what they were told. We obeyed our parents, we went to school, we joined the army and went off to war, we got a job, and we did what the company told us. We only rarely changed jobs and were dedicated to the company. Some of these attributes were very good, some not so hot.

So then came the '60, and all its fun. We had a little Defense Contractor Welfare program more commonly known as Viet Nam. We had (and still have) some politicians not worth the bullet required to shoot them. And at the same time, we became much more educated - at least the ones of us who are the achievers. And of course, the computer revolution occured.

The combination of being on the tail end of the baby boom and figuring out that always doing what we were told could get us in big trouble has profoundly changed how people relate to institutions such as the company and the government. In the workplace, as one magazine put it, professionals are now career oriented instead of company oriented.

What this means is that the traditional management model of a pyrimid with the boss on the top and the little troll worker on the bottom has been inverted. The worker, especially the skilled professional, is at the top and the underlying layers of management support him. Companies that do not realize and take advantage of this change loose good people and fail. Companies that DO understand this are much better off than under the old system. Managers can worry about business issues instead of spending time hammering work out of their underlings. And good worker can demand good working conditions, good pay, an independent environment and so on. He knows that if he does not get what he needs, he can move in a heartbeat.

This situation carrys over to ham radio. No longer does ham radio offer the state-of-the-art technology that it did 20 years ago. Now days, most technically competent people have more to bring to ham radio than ham radio has to offer in return. And the attitude is that they WORK hard AT work; in play, they are going to have fun.

No, it's not that people can't engage in a pointless hazing exercize in order to be given the priviledge of contributing, it's that they REFUSE to. Even if you don't like that attitude, you can't do a thing about it. I know that if I had not gotten my license years ago, I sure would not now. If no-code ever happened, I'd participate; if not, well I've got a bunch of equally enjoyable things to occupy my time.

> Once again you want to give in to this agency just to avoid getting someone
>angry. It might not be so bad if there was a real need for the spectrum
>BUT there ISN't. Just when do you think we should fight ? When they try to
>impinge on the 2 meter trash band ? Should we fight then ? Or how about if
>they want to re-assign 20 meters to the forrestry products people or NMR ?
>Just when is the right time ?

In any of your examples, ham radio had better have some justification other than a desire to work DX pileups for keeping the band(s). If not, we'll loose them too.

Let me throw out a little kicker to think about a bit. We continue to act like spoiled brats regarding license reform and some sharp cookie with a law degree is going to get pissed. He's going to file suit against the FCC and ham radio on the grounds that his rights of freedom of selection and freedom of association are being violated by the arbitrary and discriminatory testing regulations of ham radio. Ham radio could disappear in the stroke of a pen. Impossible? perhaps.. But consider that the courts generally only allow regulation that infringes on personal rights when the government can demonstrate a compelling and overriding need of society to the contrary. You wanna try to build such a case FOR ham radio? I didn't think you would. Or consider that there is a 10 year old case involving the NRA and the DCM that is very similiar in concept that the government and the NRA lost.

Or consider a suit that challenges the FCC's administration of the ham bands based on the allegation that the public's best interest is not being served by reserving all these bands for a bunch of hobbyists. You wanna defend that one? Didn't think so.

So let's keep this stuff up. Fight the FCC at every turn. We want them to side with the court, after all. Fight to the death to preservie the ancient ritual of the code. There are SO many societal benefits that acrue from mantaining high proficiency in the art. The wonderful thing about our society is that it usually find a way to change things despite powerful opposition.

Think about it again.

You will find a good discussion of the G5RV dipole written
by the man himself on page 86 of the ARRL Antenna Compendium.
It includes discussion of impediances on each band, feedlines,
baluns, etc. Worthwhile reading. You will note that you MUST
use a matching network with a G5RV. Good DX. 73s

Am I missing something here?
How could shutting down something already on the moon save ANY money?

I DID hear that NASA recently shut down a listening station that was picking
up signals from moon-based instruments to save $2M per year, but that
the instruments themselves were still operating.

> *think* I've read somewhere before about how one can cut a piece of cable
> to a certain length and short it at the end to kill the frequency of said
> wavelength. Something like this...

Make that HALF the wavelength if it is shorted, a QUARTER if it is open.

Alternatively, a HALF open or QUARTER shorted at the DESIRED frequency will
pass that frequency, and reduce many others. It may not reduce the pager
frequency very much.

[illustration deleted]

> The pager frequency is 152.4 Mhz. So using the ol' ARRL handbook I get a
> wavelength of 1.96 meters (length of the "stub").

That is quite close to the 2 meter band (where I suspect that your
interference is troubling you) for this. The difference in gain between
152.4 Mhz and 148 Mhz will not be very much.

> Has anyone heard of this before? I know it's cheap and dirty, but I'm not sure
> if the location of the "T" along the feedline is important. There's no mention
> of this kind of filter in the handbook, but I'm sure I've seen it before.

Generally just make sure it is not real close to other connections and things
along the transmission line that can be reflective. I'm not sure why to do
this but I've heard it before.

On the other hand, to do what you want you might need several stages, and
to get attentuation you might want on the pager frequency, and still pass
2 meters quite well, you might not only need a higher Q, but you might also
need to emphasize the desired frequency as well, to get s steep curve between
the two frequencies.

Unless someone can give you some reliable specificiations, I would not spend
a lot of money on this (but do try it). You might want to consider some
other kind of filtering.

> What ever happened to the Novice License, it's long dead...
> Why? Because it is RENEWABLE!

Based on what it was INTENDED to be, you are probably right.

> If we *MUST* have a code*LESS* license make it non-renewable!

But you must be thinking that the purpose for a code*LESS* license
is to just attract people into a starting license, so that we can
later get them to learn code and get a General or higher. And that
they would HAVE TO if it is non-renewable.

Well... you are WRONG !!!

Most of the people I know who WOULD get a code*LESS* class ham radio
license (by passing a comprehensive exam on radio theory and regulations)
would see through this trick and shy away from ham radio once again.

They are NOT interested in Morse Code (and most not in HF bands either)
and won't learn Morse Code anyway.

A NON-renewable code*LESS* license will just be another Novice license.

> If someone says they don't have time to learn how to listen,
> before they are on the air, then when their ticket expires they
> will have had a taste and if they were active the time they used on
> the air could be used to learning the code...

But they won't learn the code when they are on the air, and all the same
arguments FOR a code*LESS* license will apply again when the NON-renewable
one has expired. Why do they have to learn code to RENEW a license that
grants them privileges that don't need a Morse Code requirement in the first
place?

> But wait, these are supposed to be Smart people, they will have started
> learning the code once the realized that this ham radio stuff was neat...

They will have realized that we are trying to trick them into either wasting
their time learning something they don't need or care for, or that we are
trying to trick them into getting into something other than what they are
really interested in.

> ah but you probally disagree, that's nice... don't bother posting it because
> everyone else has heard it already...

I suppose they have. Then why did you post yours?

Probably the reason that this keeps on going is that we are in fact not yet
even arguing the same issues. Some people think that a "no code" license

is to be just an easier step into ham radio than a Novice class is. Then they argue against that, but can't understand the rebuttal because that is arguing a different issue; that a "no code" CLASS of license needs to be ADDED to Amateur Radio so that people who want nothing to do with Morse Code can help us out with our failing efforts to meet the requirements of FCC rules part 97.1 (Basis and Purpose). They won't be CB'ers, either, under some of the sane proposals I have seen (such as the one proposed by an ARRL committee give the task to study the issue) and the one I plan to send to the FCC.

These proposals are addressing entirely different issues that you are arguing against.

> Therein lies my argument for keeping the code test - dedication. We do
> not need those unwilling to put some effort into becoming a ham.

Tell me how it is that Morse Code has a monopoly on dedication. I was not dedicated to getting a ham radio license whatsoever. I first became interested in ham radio way back in 1968. I did not get licensed until 18 years later. I was not dedicated to ham radio. I was not interested in what most of the old timers think is what ham radio can only be (world-wide DX on HF bands). I was interested in (the then up and coming) FM repeaters and even Amateur TV. I was more fascinated at talking 30 miles away with an HT than in talking 10,000 miles away from a base station with a huge beam on a tower outside. I was more fascinated by seeing a TV picture form someone on the other end of town than I was by hearing dahdidahdit dahdahdidah dahdidit dahdididah.

The Morse Code requirement was NOT a barrier. I was told it was not hard to learn, and that I could learn it in just a few weeks by studying no more than 30 minutes each day. I believed it.

However, the Morse Code requirement made a different implication to me. It said to me that ham radio was something else than what I was interested in. It said ham radio was shortwave DX-ing and CW contests. It said that things like FM repeaters and ATV were just passing flukes, and that eventually the "real" hams would be cured and get back on the HF bands where all hams belong. I wasn't interested in THAT kind of ham radio.

What I wanted was for something else. I wanted something where I could do stuff like FM repeaters and ATV, but not be a ham. CB had just started, but that, too, was something else. CB'ers were just a bunch of people talking at (yes, AT) each other on a few channels. I wanted to experiment and do interesting stuff. By 1974 I had even thought about the idea of having an Experimental Radio Service. It would get all the ham radio bands that the hams I perceived of at the time "were not using", i.e. 144 Mhz and up.

I knew there were SOME "deviant" hams who also got on those frequencies and did interesting things. They might get mad if the frequencies would be taken away from ham radio. But they could an experimental license, too, and

still do everything anyway.

Well, time passed. I didn't learn anything about how the FCC regulations worked until 87-14 came along (I learned fast). In 1986 I happened to see a poster on campus here that advertised a ham radio class. It said that Morse Code would also be taught. I figured that maybe I could just go and see if it would work out this time. I had tried once before when I was in Columbus, Ohio, but the big ham club there, the one that met in COSI, was offering a class where the only Morse Code instruction was that they would just hand out code tapes. But it turned out that the Synton Amateur Radio clube of the University of Illinois had the right ideas. It took the excellent introduction to ham radio by KA6A and the dedicated instruction of NK9E who actually spent time working with Morse Code, to keep me interested long enough to get the Novice ticket. I went into it with a scheme: I wouldn't tell them I wasn't interested in that "shortwave and morse code junk". I would just bite the bullet, get it over with, and go do some of the interesting stuff.

The Morse Code was actually easy. Still, it was a very sour taste because it was something I knew I would just forget (intentionally) after it was done. I kept thinking to myself, "why waste my time with this stuff if I am just going to forget it". Well, I did forget it, but I am a Tech now, and am very proud of it, not because I wasted some time learning a skill that I don't use, but because I now really know how and why radio's work and I know how to use one second nature, like driving a car.

There are a lot of other people out there who might very well be interested in some of these kinds of things that I am interested in. Include in that list today's new packet radio. Those people are not interested in talking around the world. They can pick up the phone and dial a special access code and talk. The phone connection to Finland was much better than any DX I have heard.

What makes sense, even today, is to establish a separate Experimental Service, just for people who are interested in these "different" kinds of things. Why does it make sense? The same reason still applies: the hams who ARE interested in HF and CW and DX and stuff like that think that everyone who is going to get a ham radio license needs to learn, not just a little about Morse Code and what it is and how to use it, but a full immersion in it. They probably find it hard to imagine that anyone would even want to try to forget it once they learned it. They probably find it hard to imagine not being interested in the shortwave bands.

Still, the very reasons as stated in paragraph 97.1 of the FCC rules for the justification of allocating radio spectrum to the Amateur Radio Service equally applies to these people who are being systematically excluded from the VHF and UHF frequencies they are interested in just because some HF'ers want to make them learn the CW "radio lifestyle". The Experimental Service could have the same justification, and take the Amateur Frequencies above 144 Mhz. There would still be a theory and regulations test, and it would probably be a better one. There would not be a Morse Code test, simply because there would be no need for it, and there would not be any of those

"old timers" in the (new) Experimental Service anyway. It would work.
Sure, the HF'ers would be mad that the VHF'ers escape their grasp and went
off to do their own thing. And most of the rules in the Experimental Service
would even be copied from the Amateur Service.

If there had been an Experimental Service a long time ago, I would have
gotten my license quite easily. But some hams would not have it that way.

Interesting thought. But in retrospect, it would make even MORE SENSE to
just have ALL these people from both services in one single radio service.
The only barrier to doing this is to stop all the nonsense of the morse
code addicts trying to push their ways onto everyone else. Back in 1930
it made all the sense in the world to test for a Morse Code skill because
there wasn't much else (a few "deviants" were playing around with phone).

The idea of "no code" is NOT to eliminate Morse Code from the ham radio bands,
or even to remove the requirement that it be learned to earn privileges in the
HF bands. The idea is really to establish something like the "Experimental
Service" for people with interests only in those areas, and to have it as a
PART OF the Amateur Radio Service so that we all can benefit from each other
together, and the public can benefit even more from the combined efforts to
meet the goals in 97.1 (the whole being greater than the sum of the two).

It's a matter of options. By adding "code-free" license classes to the
Amateur Radio Service, we are adding to Amateur Radio, not taking away from
it. Amateur Radio then does NOT become a "codeless" service, but will be a
CODE OPTIONAL Service, where Morse Code still plays an important role. Yes,
I am still convinced that Morse Code can still continue to be a valuable skill
that can serve us and the public quite well in certain extreme circumstances.
Many hams will still continue to be interested in Morse Code, and will
maintain a sharp operating skill that includes the code, ready for emergency
uses in those special cases we hope never do occur. I just happen to be
interested in other areas and don't have the time to be involved in all the
the things that the Amateur Radio Service is.

Now, I hope that clears some things up for you.

1697. Info about 6 meters (LONG)

Newsgroup: rec.ham-radio
Date: 1989-07-22 12:44:29 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <8907221244.AA03363@cmr.ncsl.nist.gov>
Source record: 17971

This is extracted from a message I recently sent to someone who enquired about six meters. Since I just saw another such request, I'm posting it for general information. Absolutely no endorsements are given, especially no endorsements from my employer.
****

Firstly, six is something of an acquired taste, I suppose. There is relatively little FM activity on six, and in any case I don't take part in it. I'm on the low end; the place where SSB/CW activity is concentrated. There is not much local rag-chewing on six. Except as mentioned below, there has been essentially no packet work on six.

Most of the SSB/CW operators on six are at least vaguely interested in radio propagation effects. One of the things that keeps many people on the band is that nearly every propagation mode know to hamdom happens on six at one time or another. It has held my interest for many years. Oh sure, I've done some operating on other bands, and have been pretty inactive for a year or so at times, but ....

OPERATION

Operation is mostly on SSB, but switching to CW is common for really weak sigs, and a few people operate nothing else. Per the FCC, SSB must be above 50.1 MHz. The DX calling frequency is 50.110 MHz. An attempt is underway to leave 50.100 to 50.125 clear from domestic QSOs, to give the DX stations a chance to be heard. With that in mind, a second (domestic) calling frequency of 50.125 MHz is in use. Only on the wildest of Es openings do you find SSB operation much above 50.200 MHz. The are a few dozen CW propagation beacons in the 50.060 to 50.080 MHz region in the US, and others elsewhere around the world in the 50.0 - 50.1 range. As well as signal reports, most stations exchange "grid square" information. On VHF and up bands, the world has been divided in 1-degree lat x 2-degree long "squares" which start at the south pole and date line and "read right up". I am in FM19, for example - actually FM19DA, each major "field" (FM) being divided 10x10 into 100 squares (19) and "square" being divided 10x10 into 100 subsquares (DA). European stations like

the subsquares; most US stations don't even know their own. In any case, the "squares" and their VUCC awards have been a wonderful interest builder, and have kept the QSL printers in business!

RIGS

The equipment situation is easy to cover, so I'll do that first. Probably 50% of the active stations have 80 to 150 W output, either from old Icom 551D s (the 551 is 10 W), or from solid-state (brick) amplifiers following the many types of 10 W rigs. Perhaps 40% of the stations run just 10 to 20 W, but most of them either get an amplifier or drop out after a year or so. The remaining 10% have either tube rigs such as the Drake TR-6, Swan 250 (too drifty!), Heath SB110A (spurious sig 150 kHz or so from output), or high-power amplifiers. The kilowatt is quite rare on six (see below for why). The norm for "serious" stations is the 150 W amplifier. I've gone through some of my grid-square cards for the station information contained thereon. Note that some of these cards go back six years.

- "BAREFOOT" POWER - WITH AMPLIFIER
RIG <25W <100W >100W <kW kW
Drake TR6 7 2
Heath SB110 2 1
Homebrew 4 1 1
Icom 505 1
551 14 3 3
551D 21 2
560 2 1
Kenwood TS600 5 2 1
TS660 2 1
TS670 2 1
TS680 1
Swan 250 11 2
Transv/someHB 10 4
Yaesu FT620 6
FT625 6 2
FT690 3
FT726 4 1

TOTAL 56 25 21 12 15
(sum=102, 37 having < 25W, including amplifier)
(22 having 25-100W, incl. amplifier)
(43 having >100W, including amplifier)

I'm sure that this list slights the more recent rigs. It merely reports what has been on the air 1983-1989. No endorsements are given, your mileage may vary.

ANTENNAS

A beam is essentially necessary. Everyone is horizontally polarized, but cross-polarization doesn't matter for Es or F2. A few stations use 3-element beams, but a 4 or 5 element beam is so small that a LOT of people use them. Quite a few people have Cushcraft 6-element "Boomers". Mine really over-shadows the house!. There are a few other big beams, and the lunatic fringe stacks them, etc.. The higher the tower the better! RG8 or RG213 is plenty good enough cable for most people. Antenna-mounted preamps are never needed. External noise is fairly high at 50 MHz. It overrides the front-end noise figure on about all the rigs on the market today unless you have a LOT of cable loss or a VERY quiet location.

Also from my cards: (largest beam = 44 elements!)
NUMBER OF ELEMENTS
<3 3 4 5 6 >6
this size 9 8 15 22 30 19
HEIGHT (FEET)
<26 26-55 56-100 >100
this height 10 35 18 3

PROPAGATION

Tropo - The ordinary ground-wave tropo range on six isn't quite as great as on two. There are a number of reasons. Since there are so many other prop modes on six, people don't try so hard on tropo. Antenna gain often is higher on two. Noise is lower on two. At least in the summer, stations like W3BWU (Pittsburgh), W3IDZ (northern NJ) are easily worked from here with the beam pointing at them, and can be heard at almost any pointing. They are in the 150-W class.

Meteors - Any area workable by meteors can be worked more easily by Es or aurora. Even though meteor sigs are much strong and longer on six than on two, little use has been made of them. There has been a VERY little meteor-burst packet work on six. I had the first such contact (with W0RPK). W3XO worked him a few years later.

Ionoscatter - Some people think it's really meteors, but every weekend morning there are a number of nearly-kilowatt stations working each other on SSB at distances of about 600 - 1000 miles by ionosperic scatter. Sigs are weak, and it takes good beams, height, and power, but it is very reliable. See the old NBS papers by Bailey, Bateman and Kirby, et al. Bateman and Kirby were/are hams. Ross Bateman died last year. Dick Kirby continues as head of CCIR in Geneva.

Aurora - Much easier than on two. SSB is usually intelligible. Point north about dusk, most commonly in March and October/November. Lots of people work this mode when it happens.

Es - You know something about Es from TV DXing. Having much better antennas, modulation, and receivers, hams do a lot more with it on six than you are used to on channel 2. It is most common from May to August, and around Christmas, here in Northern latitudes. In addition to the common single-hop range of 500 - 1500 miles, there are quite a few double-and-more hop contacts on six. Now that a number of Europeans are on six (with LOW power), we find that they can be worked from the US east coast each summer. Likewise the Caribbean stations work all over the US. The US west coast has an easy time with Hawaii and Alaska.

F2 - This is the traditional world-wide F-layer propagation you know and love from 20 and 15 meters. At most sunspot maximum periods, a few years of each eleven, the MUF reaches above 50 MHz in the autumn and spring. It isn't every day, but even antipodal communication has happened. The leaders are now approaching 100 countries. But they have spent MANY hours over many years trying to catch the fleeting opening. F2 brings an influx of the lower-band DX operators. The normal rather gentle operation gets somewhat lost at those times.

Transequatorial Propagation - The southern US gets a number of openings to South America by some kind of ionospherically-ducted propagation. The stations are generally about equidistant either side of the magnetic equator. Given exceptional luck, an Es opening linked into this mode can make it available to more northern stations. This mode has bad flutter fading and a touch of the auroral spectrum spreading. This mode also works sometimes on two meters if you use CW and really good gear. It has been worked on 432 MHz.

EME - There have been a few EME contacts on six, but the required antenna size and high background noise makes it out of the reach of most people.

Did I leave any modes out?

TVI, ITV

There is no doubt about it, six has TVI troubles. You don't find a lot of people on six in channel 2 areas unless cable is widely subscribed-to. Many VCRs and audio systems are also prone to six-meter pickup. The common connecting or power cable is a quarter-wave

antenna for six .... The TV owners have their revenge since the 13th harmonic of the color subcarrier, or something, of TV sets and TV games puts out a birdy at 50.113 MHz to bother the six-meter operators in return.... There is also quite a bit of trouble from noisy power distribution lines if they aren't buried (usually bad insulators or poor guy bonding).

STILL INTERESTED?

That should be enough to hold you for a while. Listen to 28.885 MHz, the ten-meter liaison frequency for overseas six-meter DX.

73,
Bob W3OTC

I REPEAT - NO ENDORSEMENTS ARE GIVEN.

1698. Re: HRO

Newsgroup: rec.ham-radio

Source record: 17972

Hi netters,
I am new to this newsgroup, as also to ham-radio. I would
appreciate if someone could send me the address/phone of the HRO,
preferably in Austin/Texas and other places I can get some new/used
equipment, or direct me to where I can find such info.
Sorry about the bother, but as a newcomer I was quite lost!
Thanks in advance.

73s de Raj (VU2RPM)

1699. Opinions on Yaesu FT767, Kenwood TS440AT, Icom IC725 sought

Newsgroup: rec.ham-radio
Date: 1989-07-22 20:14:26 UTC
From: rick@sbcs.sunysb.edu
Message-ID: <3191@sbcs.sunysb.edu>
Source record: 17973

I am considering upgrading my venerable old FT301D to something a bit more recent, ie radio with general coverage rcvr, WARC bands, computer interface, etc. The three rigs that interest me after going through various data sheets, buyers guides, etc are the Yaesu FT767, Kenwood TS440, and Icom IC725. I would appreciate hearing from persons owning one the these rigs - complaints, complements, grumblings, etc all accepted with thanks :-)

Rick Spanbauer, WB2CFV
SUNY/Stony Brook

PS. I would also appreciate pointers to any reviews that analyze rcvr performance of the mentioned rigs, too.

1700. HAM Radio on the Space Shuttle

Newsgroup: rec.ham-radio

Cross-posted to: rec.ham-radio,sci.space.shuttle

I posted this query once to ham-radio.

I've heard that there will be a shuttle mission next year that will have
an amature radio operator and his rig on board. I have also heard that
there have already been two missions like this already. Can ANYBODY give
me more information on this, past and future. I am especially interested
in frequiences, orbits, power, etc.

david.

DISCLAIMER: If it's important have a backup. If it ain't broke don't fix it.
Proceed at your own risk. My oponions are my own. Spelling does not count.
My fondest dream is to leave this planet.

:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2051--July 11, 1989 ::
::::::::::::::::::::::::::::::::::

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Bengt Dalhammar.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2051

-------------------------------------------------------------------------------

BABY NEWS--Just a note from a proud father that Daniel MacClaren Wood was
born on July 5th. Mother and child are doing fine.

COMPUTER CORNER--A few weeks ago we mentioned that there was no way to get
through to our Radio Sweden mailbox on the FIDO-Net system of computer bulletin
boards from academic computer networks like Inter-Net. Well, a flury of
messages to our mailbox has proved us wrong. A number of people, including
Rui_Tao Dong, David Dodell, and not least Ralph Brandi have written about the
gateway between the two systems.

If you are on Internet or UUCP/Usenet, you can send messages to Sweden Calling
DXers using the following address:

George.Wood.@f297.n202.z2.fidonet.org

Tom Sundstrom has sent us a number of new programs that he is selling for MS-
DOS and PS/2 computers. Tom won a World Radio TV Handbook award for his
shortwave software.

The latest edition of the English Language Shortwave Broadcast Schedules is a
database of more than 550 entries from more than 70 countries. You can search
for a particular country or see what is on the air at any time of the day. You
can print out information in a variety of formats. With the appropriate
interface and correct wiring of the serial cable, you can load the frequencies
directly into a JRC NRD-525 or a Kenwood R-5000 receiver.
```

You can edit the database yourself, or subscribe to Tom's update service. Updates are available both from Tom's bulletin board, the Pinelands RBBS or by disk.

Tom Sundstrom also has a utility logbook program that allows you to collect information on utility stations reported in magazine columns and club bulletins into one file. As you log the stations, you can add your logging information and notes. You can also print out reports in different formats for submission to various magazine columns.

Tom has also developed receiver control programs for the NRD-525 and R-5000 receivers. These require special hardware interfaces from the manufacturers, but allow you to load lists of frequencies into the receiver memories, along with a number of other features.

The English Language Shortwave Broadcast Schedules program costs USD 20, as does the Utility DXers Logbook, plus shipping. The control programs are USD 50 each, plus shipping. Shipping is USD 2.50 in North America, USD 5 for airmail to the rest of the world.

Tom Sundstrom has a number of other programs available. You can contact him by mail to Box 2275, Vincentown, New Jersey 08088-2275, USA, or via MCI Mail to ID 244-6376. You can also call the Pinelands RBBS at American telephone number 609-859-1910.

ANGOLA--Updating SCDX-2049, the unidentified Angolan station reported two weeks ago is probably Emissora Provincial de Cuando Cubango, which has been heard at 20:45 hours on 4872.2 kHz. (Nils Jakobsson and Bjoern Fransson, Sweden in ShortWave Bulletin) This station is listed in the WRTH as operating irregularly on 4780 kHz. See also Mozambique.

BOLIVIA--Radio Perla del Agro in Cobija, Pando is a new station, which has been heard from around 23:20 hours until sign off at 02:04 hours on 4600 kHz. (Stefan Bjoern, ShortWave Bulletin, and PLAY-DX, Italy) Radio Perla del Agro was also heard at the EDXC meeeting at Morokulien on the Swedish- Norwegian border at 02:10 hours on 4600 kHz.

Radio Abaroa has been heard on 4719.9 kHz. (ShortWave Bulletin) This frequency was reported in SCDX-2046 as used by Radio Riberalta.

BOTSWANA--Radio Botswana has immediately leaped in to use 4830 kHz, recently vacated by Africa No. 1 in Gabon. It's been heard there 18:30-20:00 hrs. (Wian Stienstra, Netherlands) This would seem to replace 4820 kHz.

BURUNDI--Radiodiffusion du Burundi has been heard with programs in French around l9:l5 hours on 3300 kHz and around l8:20 hours on 6140 kHz. (Timofeyev, USSR in PLAY-DX)

CANADA--Updating SCDX-2047, Radio Canada International can also be heard in English to Latin America at 01:00 and 02:00 hours on 13720 kHz and in French to Europe at 18:30 hours on 13660 kHz. (Vidjit Vijaysanker, India)

COLOMBIA--Updating SCDX-2045, La Voz de la Cana, which was reported as operating from Cali on 5068 kHz some weeks ago, has apparently nothing to do with La Voz de la Cana in Cali but is more likely to be some kind of a

clandestine or pirate operation. (Henrik Klemetz, Sweden in PLAY-DX)

EQUATORIAL GUINEA--Updating SCDX-2045, Radio Africa is now scheduled 17:00-23:00 hours on 7190 kHz according to information from Pan American Broadcasting, Cupertino, California. (Salvatore Placanica, Italy and Ulrich Berens, West Germany) Radio Africa has been observed with a religious program and fair strength at 21:00 hours on 7189 kHz. (Finn Krone, Denmark in ShortWave Bulletin)

From July 1st Radio Africa will also operate under the name of Radio East Africa. These transmissions are scheduled to be on the air from 05:00 hours to 14:00 hours on Saturdays and Sundays on 9585 kHz, targeted to Kenya, Uganda and Tanzania. (A. A. Zijlstra, Netherlands)

GABON--On June 18th Africa No. 1 was observed on 9580 kHz at 19:00 hrs. This frequency, which was in parallel with 15475 kHz, appears to replace 4830 kHz, which was used 05:00-06:00 and 16:00-23:00 hrs. (BBC Monitoring)

IRELAND--Updating SCDX-2048, Radio Dublin is now back on the air 24 hours a day on 1188 and 6912 kHz and FM 99.97 MHz. A station called WABC can also be heard on FM 101.7 MHz. (Stuart Dobson, England)

MOZAMBIQUE--Radio Mozambique has been observed with the A program from 19:55 hours to sign off at 22:07 hours on 4872.4 kHz with fair to good strength with popular music. (G. Zella, Italy and participants at the DX Camp outside Copenhagen recently held by the Danish Shortwave Clubs International) See the Angolan station mentioned above, can these actually be the same station? (DX Editor)

NORTHERN MARIANA ISLANDS--KYOI, now belonging to the "Christian Science Monitor", ceased operation on July 3rd for four months for the installation of new transmitters. KYOI will return to normal full schedule programming in November l989. (Vidjit Vijaysanker, India and Lau Tech Yew, Singapore)

PARAGUAY--Radio Nacional de Paraguay has been heard with soccer football around 17:45 hours on 6025 kHz. (Gerardo Evangelista, Argentina) Radio Encarnacion was noted at the end of May back on 11945 kHz after a period of inactivity. (ShortWave Bulletin)

PHILIPPINES--Updating SCDX-2049, Radio Veritas Asia can now be heard in English 15:00-15:30 hours on 11740 and 15445 kHz and 01:30-02:00 hours on 15320 and 15360 kHz. (Salvatore Placanica, Italy: and Mansur Rahman, Vidjit Vijaysanker, and Sanil Deep, all in India)

SRI LANKA--The Sri Lanka Broadcasting Corporation has begun a new commercial service in the Tamil language for Asian listeners from 11:15 hours to 13:15 hours on 882 kHz. (M. Ulaganathan, M. Ganesan, and M. Dhanagopalan, all India)

TURKEY--The Voice of Turkey can now be heard in German 16:30-l7:25 hours and l9:30-19:55 hours on 9825 kHz. (Andreas Mieth, GDR and P. Leuther, West Germany) There are also broadcasts in English from the Voice of Turkey 20:00-21:00 hours and 22:00-23:00 hours, both on 9825 kHz. (Ulrich Berens)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
03:00 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21675 kHz (East Africa)
17:00 hrs on 1179, 6065, and 9615 kHz
21:00 hrs on 1179, 9655 and 11705 kHz

And to Asia and the Pacific:

12:30 hrs on 17705 and 21610 kHz
14:00 hrs on 17705 and 21610 kHz
01:00 hrs on 15390 and 17790 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks for 47 contributors this week Good Listening!

:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2052--July 18, 1989 ::
::::::::::::::::::::::::::::::::::

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Ingemar Sandberg.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2052

-------------------------------------------------------------------------------

SATELLITES--An Ariane 3 rocket has carried the Europe's Olympus 1 direct
broadcast satellite into orbit. At 2800 kg, Olympus was the largest payload
ever carried by an Ariane rocket, and was the last launch for Ariane 3, which
is to be succeeded now by Ariane 4. Besides two high-powered television
channels, Olympus will relay specialized point-to-point communications, such
as video conferences, data transmissions, and educational television, between
frequencies of 12 and 14 GHz. One of the TV channels is for Italian
television (12.16862 GHz), the other for European broadcasters (12.14534
GHz).

With 3 transponders in the unusual frequency range of 20 to 30 GHz, Olympus
will for the first time attempt to relay video conferences and data across
frequency bands as wide as 700 MHz. Olympus is to be placed at 19 degrees
West longitude. (Dow Jones, "New Scientist", and "1988 World Satellite
Almanac")

ANARC--Some 150 radio listening hobbyists and broadcasters gathered July 15-
17 for the annual convention of the Association of North American Radio
Clubs, in St. Petersburg Beach, Florida. Because of its location there was a
Caribbean/Central American theme, and highpoints included talks by Dr.
Ernesto Betancourt, the director of the anti-Cuban government station Radio
Marti, whose keynote speech was entitled "Radio Marti in an Era of Glasnost";
DX journalist Glenn Hauser, who presented slides about Central American radio
stations; and exiled Panamian Senator and radio journalist Mayin Correa who
spoke about the role of radio in democratizing Panama.
```

There were non-Caribbean items as well. Mike Villard presented interference-reducing antennas for shortwave, which he developed for the Voice of America before jamming in Eastern Europe ended.

"He brought his antennas with him and showed them off and talked about the concepts," says ANARC Executive Secretary Robert Horvitz. "People were just aglow with the possibilities because these are all simple enough to make and experiment with."

This week marks the 20th anniversary of the launching of the first Apollo mission to the Moon, from nearby Cape Canaveral. Alan Parrish of the National Aeronautics and Space Administration spoke about the use of two way radio on the space shuttle missions.

ANARC's European counterpart, the EDXC, has been experiencing problems recently. Complaints about the annual EDXC conferences led to the holding of two gatherings this year, and clubs have been experiencing declines in membership. This has not been a problem in North America.

"Overall membership in all of the clubs that make up ANARC has remained essentially unchanged," says Robert Horvitz. "But there has been a significant redistribution of membership. The large shortwave clubs are losing members to the regional clubs, the scanner clubs, and the specialized clubs."

Congratulations to organizer Jeff White on a job well done! There's a bid to hold next year's ANARC convention in Virginia Beach, Virginia in September. (George Wood)

BOLIVIA--The Radio Television Popular network resumed its activities on June 19th--a year after it was closed by the authorities for "violating national laws". The network had broadcast comments by drug-trafficker Roberto Suarez Gomes, which the government believed harmful to national dignity. (BBC Monitoring)

On 28th June, Radio Horizonte from La Paz was observed signing on in Spanish at 10:00 on the new frequency of 6005 kHz. The opening announcement also mentioned 1060 kHz. (BBC Monitoring)

CANADA--CKZU, the CBC station in Vancouver on 6160 kHz, announces the new sign on time of 12:30. (Arthur Cushen's DX World)

COLOMBIA--Updating SCDX-2045 another old Radio Sutatenza frequency - 810 kHz - is now being used by the Caracol network. (Richard E. Wood, Hawaii)

Caracol, Bogota, which was reported to use 5075 kHz, now seems to have moved to 6075 kHz. Heard around 08:00 hrs but mixed with Deutsche Welle on the same frequency. (Arthur Cushen's DX World)

Radio Reloj, Neiva, now uses new 6150 kHz, heard around 08:30, identifying as HJFR and the Caracol Network. (Arthur Cushen's DX World)

CZECHOSLOVAKIA--Radio Prague in English at 01:00-02:00 and 03:00-04:00 uses the new frequencies of 13715 and 15540 kHz. (Arthur Cushen's DX World)

GUAM--AWR-Asia will open an FM station by the end of 1989. The 3 kW transmitter will operate 24 hours a day. (Aboe Nawan Thaliep, Radio Listeners Club Indonesia)

English programs from AWR on shortwave are now broadcast: at 00:00 on 15125, 10:00 on 13720, 16:00 on 11980 and 23:00 on 15125 kHz. On Saturdays and Sundays also at 02:00 on 11700 kHz. (Aboe Nawan Thaliep)

HUNGARY--Balaton Channel TV-S, the first commercial television station in Hungary, went on the air on July 1st. Programs are in Hungarian and German and will be transmitted from the Siofok Cultural Centre for 72 days during the Summer 08:00-10:00 and 20:00-24:00 local time. The limited company is run mainly by Siofok Television, set up by Siofok town council, and by Filmpremier, a small co-operative. (Wojciech Zajac, Poland and BBC Monitoring)

The two US government-financed radio stations Radio Free Europe and Radio Liberty are this summer to open a news bureau in the Hungarian capital Budapest. The president of the two stations, Eugene Pell, says that the Hungarian government has given approval for the accreditation of a radio correspondent. To begin with, a journalist from Hungarian Radio would work for Radio Free Europe and Radio Liberty. It is the first time that both stations have been allowed to open a bureau in an Eastern bloc country. (BBC Monitoring)

INDONESIA--The Radio Republik Indonesia Programa Nasional, Jakarta, now broadcasts on 15155 kHz between 10:00 and 11:00 with 7270 and 999 kHz in parallel plus 104 and 106 MHz FM. Between 17:00 and 22:30 the frequencies are 3275, 4775 and 6550 kHz. (Aboe Nawan Thaliep)

NORTH KOREA--Radio Pyongyang in Russian at 16:00-16:50 is noted on new 11760 kHz replacing 11740 kHz. 9325 kHz remains in parallel. (Richard E. Wood)

PHILIPPINES--According to the "Manila Chronicle" a pay dispute threatens to silence the Catholic Church-run Radio Veritas at the end of this month. (BBC Monitoring)

POLAND--Radio Polonia has introduced a program in German at 05:30-06:00 on 5995, 7270, 9675 and 1503 kHz. (Herbert Aichele, West Germany)

SOUTH AFRICA--Updating SCDX-2043, Radio RSA has a fairly new service in Afrikaans to Southern Africa. Interval signal is noted at 03:50 on 4965 and 6130 kHz. At 05:00 11810 is added. This service seems to coincide with the impending independence of Namibia where Afrikaans is widely spoken. (Richard E. Wood)

SRI LANKA--The Deutsche Welle relay station in Trincomalee will go into full operation this month. The installation of the station has been interrupted several times because of the internal situation in Sri Lanka. In May 1988 work resumed at the station and all technical equipment was operational by October 1988. Since then there have been daily transmissions from 07:00 until 17:00. (BBC Monitoring)

TURKEY--The Russian programme from the Voice of Turkey has moved half an hour earlier and is now at 14:00 on the new frequency of 15105 kHz. (Alexander Zacharov, USSR)

The Voice of Turkey now broadcasts twice a day in German: at 16:30-17:25 and at 19:30-19:55, both on 9825 kHz. (Herbert Aichele)

USA--Next month is the historic 50th anniversary of the start of commercial short wave broadcasting from the United States. A number of American commercial short wave stations broadcast to Europe and Latin America during World War II and were very popular.In 1942 some of them became part of the Voice of America. The Crosley Company's WLWO is now VOA's Bethany, Ohio transmitter site. KGEI in San Francisco now belongs to the FEBC and still exists. And W1XAL, Scituate, Massachusetts in 1939 became WRUL. In 1962 this station broadcast Spanish to Cuba during the Cuban Missile Crisis and then became WNYW and finally in the 1970's became WYFR and moved transmitters to Okeechobee, Florida, and studios to Oakland, California. (William Dickerman, USA)

YUGOSLAVIA--Radio Yugoslavia is noted on new 21555 kHz with sign on in Serbo-Croatian at 07:00 on a Saturday. (Richard E.Wood)

Radio Yugoslavia in German in 16:30-17:00 is on new 7215 kHz with 9620 kHz in parallel while German at 19:30-20:00 uses two new frequencies: 6100 and 7215 kHz with 9620 remaining in parallel. (Horst Veit, GDR)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
03:00 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21675 kHz (East Africa)
17:00 hrs on 1179, 6065, and 9615 kHz
21:00 hrs on 1179, 9655 and 11705 kHz

And to Asia and the Pacific:

12:30 hrs on 17705 and 21610 kHz
14:00 hrs on 17705 and 21610 kHz
01:00 hrs on 15390 and 17790 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 28 contributors this week Good Listening!

============================================================

WHAT IS AMATEUR RADIO, YOU ASK...?

Amateur Radio (often called "Ham Radio") is a hobby and an
important public service authorized by the U.S. Federal
Communications Commission in Part 97 of the FCC Rules and
Regulations. It's stated purpose, quoted from SubPart A, Sec.
97.1 is as follows:

"...to provide [a] service...as expressed in the following
principles:
(a) Recognition and enhancement of the value of amateur
service to the public as a voluntary noncommercial service,
particularly with respect to providing emergency
communications.
(b) Continuation and extension of the amateur's proven
ability to contribute to the advancement of the radio art.
(c) Encouragement and improvement of the amateur radio
service through rules which provide for advancing skills in
both the communication and technical phases of the art.
(d) Expansion of the existing reservoir within the amateur
radio service of trained operators, technicians, and
electronics experts.
(e) Continuation and extension of the amateur's unique
ability to enhance international goodwill."

Licensed Amateur Radio operators are people of any age,
sex, profession, or nationality who are fascinated with
communication via two-way radio. Generally a skilled group,
they are required to pass examinations to receive the
authorization to operate an Amateur Radio station.

The typical Amateur has a variety of interests, and the
hobby provides for a multitude of individual preferences.
Amateurs engage in general chit-chat; emergency operations
(including participation in Civil Preparedness); sending,
relaying, receiving, and delivering free Radiograms for the
public; providing communication support for civic functions
such as local parades, marathons, etc.; making friends with
Amateurs in foreign countries; investigating the mysteries of
radio signal propagation; building, modifying, and designing
radio equipment, antennas, and accessories; winning awards for
```

operating proficiency in many areas; helping others prepare for Amateur Radio FCC license examinations; and many more exciting and valuable facets of the hobby.

The FCC grants five classes of licenses to operate Amateur Radio stations, each requiring the candidate to demonstrate progressive levels of ability and knowledge. The license Classes are as follows (from lowest to highest), each successively allowing greater operating privileges and access to more usable radio frequencies):

For most persons, the initial license is Novice operator. It requires the applicant to pass an elementary written test and to demonstrate the ability to understand Morse Code when sent at just 5 words per minute (wpm). Novices are authorized to use the following radio frequency ranges, or "bands" (bands are often referred to by their approximate wavelength, as well as by frequency): 1.25 meters (222.1-223.91 MHz), 23 centimeters (1270-1295 MHz), 10 meters (28.1-28.5 MHz), 15 meters (21.1-21.2 MHz), 40 meters (7100-7150 KHz), and 80 meters (3700-3750 MHz) bands. The Novice license examination is administered by two Volunteer Examiners (VE's). These may be any Amateur Radio operators who hold a current General, Advanced and/or Amateur Extra operator license. There is no charge for taking the Novice class examination.

The second step up the ladder is the Technician operator. Another written examination, Element 3(A) is required. This license authorizes privileges on all Amateur bands from 6 meters (50 MHz) on up to 248 GHz, plus all Novice privileges.

The third step up the ladder is General operator. Another written examination, Element 3(B) must be passed, as well as a test to demonstrate the ability to understand Morse Code at 13 wpm. This license authorizes the use of designated portions of all Amateur service frequency bands.

The fourth step up the ladder is Advanced operator. Another written examination, Element 4(A) is required. This license authorizes additional frequency privileges on Amateur service high-frequency (HF) bands, from 1.8 to 30 MHz.

The final step up the ladder is Amateur Extra operator. Another written examination, Element 4(B) and 20 wpm Morse Code proficiency is required. This license authorizes ALL Amateur Radio privileges and frequencies, including additional frequencies in the Amateur service HF bands.

For all licenses above Novice operator, the examinations are administered by at least three local Amateur operators serving as Volunteer Examiners (VE's). They provide information as to when and where examination sessions are being

held. Their efforts are coordinated by a Volunteer Examiner Coordinator (VEC). The VEC makes public the questions used in the written examinations. Study aids are available from many Amateur Radio publications and equipment dealers. The administering VE's may charge the candidate a fee as stipulated by the FCC for certain reimbursable expenses incurred in preparing, processing, or administering the examination (currently $4.75 per exam session, regardless of how many Elements are taken).

Many licensed Amateurs enjoy joining and participating in local Amateur Radio clubs. These clubs provide comradeship, coordinate special activities, support members via exchange of information, and often have members who conduct free FCC exam preparation classes for people interested in getting licensed.

Amateur Radio is a versatile and flexible hobby. Some people get on the air with minimal equipment, home-building, borrowing, or purchasing used transmitting and receiver gear for very low costs. At the other extreme, Amateurs can easily invest tens of thousands of dollars in the latest transceivers, antennas, towers, computers, accessories, and other gadgets that reflect the top equipment from major manufacturers. Most Amateur Radio stations fall somewhere between the two. Amateurs tend to collect, swap, and sell gear and over the years may accumulate an impressive setup for a relatively low cash outlay.

Anyone interested in becoming involved with Amateur Radio can find out more very simply by contacting the American Radio Relay League (ARRL), 225 Main Street, Newington, CT 06111 (203-666-1541). This is the leading nonprofit organization dedicated to Amateur Radio, and is made up of thousands of members all over the United States. You can also look through local hometown newspapers for listings of local Amateur Radio club meetings; knock on the door of anyone whose home sports a bizarre array of radio antennas; or contact me via telephone, U.S. Mail, or BBS.

Amateur Radio is a truly unique and thrilling avocation that can give years of unforgettable pleasure and allow you to serve your community in a very distinctive way.

1704. Re: residential autopatch rates

Newsgroup: rec.ham-radio
Date: 1989-07-22 23:17:51 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500084@ux1.cso.uiuc.edu>
Source record: 17828

What you might TRY to do, is to establish a "residence" at some remote location and order residential phone service, using that address for both service and billing purposes. This may not fool, but if you have a way to do it (a cabin there for instance) then you might try it.

The matter of not putting the toll-restrict feature on is something you do need to push for. There is no TECHNICAL reason they can't do that unless they are putting residential lines on one exchange and business lines on another and the one with the business lines is an older type of exchange that isn't capable.

Under NO CIRCUMSTANCE should you EVER accept what the people at the phone company, or their supervisors or managers tell you CAN'T be done. If it is a management policy, insist on talking to the PERSON RESPONSIBLE for it who WILL be able to tell you exactly why. Likewise if there is a technical reason, you should get the same from the head of engineering. The customer service department only tells you what they are told to tell you, which is only applicable to standard routine phone service.

--Phil howard-- <phil@ux1.cso.uiuc.edu>

1705. Re: residential autopatch rates

Here is something you might also try to get a cheaper form of toll restrict that has a limited working range. If you are on a "Dial-One" capable exchange, then ask for your long distance carrier to be setup as "NONE". Again, you might have to go over the customer service department to get this, but it definitely *IS* possible and I have it that way myself. Toll calls will go through, but only those for a close region that the local company serves will get through with just 7 or 10 digits. All others require dialing a carrier selection code which adds 5 more digits to the process. These are the codes that select a different long distance carrier for the calls. 10220 = Western Union, 10222 = MCI, 10288 = AT&T, 10333 = GTE/Sprint.

IF your dialing mechanism can block out 15 digit numbers (perhaps by having memory for storing only 10 digits before dialing) then you can get a cheap way to block the more expensive calls. Regional long distance will still go through so it is not a perfect solution, but who knows, maybe it is adequate for you for the duration.

> hire a professional public relations firm who's profession and livelyhood
> is earned by getting the word out. You will generate more interest in
> ham radio this way then you will by comming up with a no-code license.

True, and we can use the added interest. However, the no-code license will
also allow us to get those who are already interested, and offended by the
silly (for VHF/UHF FM/packet/ATV work) code requirement.

> Once again, we need to get the word out when we do something worth
> while. If your group helps with a walk-a-thon then get a news blurb in

> 215-220 band ? The clintcher is that 215 to 220 is an IN LAND ie.
> Mississippi River) band and the spectrum that they claim they
> need is ON THE EAST and WEST COAST, a thousand miles away !!!!

In addition, IBM has a proven and successful system for communicating with their service technicians in ways similar to what the UPS wants to do, with low power and internal antennas on 800 Mhz. There is still some spectrum (and grabbing) up there.

> > Then to top all this off, when the FCC starts an initiative to modernize

> "Gimme" generation or the "I got a right" generation. They are afraid
> of a little work. After all why work for something when a when I
> can whine enough and someone will give it to me.

I've not heard that the military is doing this, but I do concede that the advantage exists, BUT only by virtue of its spectral INEFFICIENCY. That's right, INEFFICIENCY. If you compare voice to CW, you are comparing apples to oranges. Try comparing RTTY or packet to CW. It's all about the same, but CW is just slower. There is how it gets its apparent immunities.

No-code is not a way to modernize ham radio, which is modernizing all by its self. No-code, or more correctly Codeless-option, is a way to allow those who are only interested in the MODERN aspects of ham radio to do that kind of radio work in the VHF/UHF bands. These people don't want to be the kind of ham that traditional ham radio is all about. But ham radio is more than that today, and we need more than just people who are willing to learn something that they plan to just forget afterwards.

> Once again you want to give in to this agency just to avoid getting someone
> angry. It might not be so bad if there was a real need for the spectrum
> BUT there ISN't. Just when do you think we should fight ? When they try to
> impinge on the 2 meter trash band ? Should we fight then ? Or how about if
> they want to re-assign 20 meters to the forrestry products people or NMR ?
> Just when is the right time ?

We must protect what we have, all of it.

But lets not mix the "no-code" and the "spectrum grab" issues. They are separate even though they have some effect on each other.

> they are out of line and we have a chance of winning. (Winning in the
> big sense of long term benefit to the service.) In my *political* opinion,
> this is NOT the battleground we want to fight on.

What one is? What one will reverse the trend to take spectrum from the
hams who are just using it to play around and don't count like for-profit
businesses do?

> in proportion to our spectrum allocation, and d) how closed-minded the
> service is toward change and/or improvements, the decision is obvious.
> It then simply becomes a matter of managing the political noise for awhile.

We need to convince the FCC to listen ONLY to the group of people who want
ham radio to be the modern service it has become.
[see my summary at the end]

> That they already have spectrum "available" is not an issue. UPS can
> make the very valid business argument that since the chunk of relatively
> unused (definition above) spectrum is available, it should not have to
> either a) develop some expensive new spectrum-conservative technology or
> b) reallocate some other commercial band. They can make the point that
> our use of the spectrum has no commercial value. The only counter to that
> argument is a political one. And politics live and die on money and public
> opinion. We have too little of either at the moment.

The correct argument should be that the spectrum has value, even though that
value is non-commercial, and that it is being used, even though monitoring
it reveals to the limited monitoring facilities that it is unused. In fact
it can be in use without even having RF on it, just like radio astronomy.

> You can flame me all you want - this is not my opinion. It is the argument
> I'd use were I on the other side and it carries a lot of merit.

Too bad that it does carry merit in the minds of the people who are making
the decisions. We do have to fight this, though, and not just give them out
implied endorsement. Yes, it IS political, and that is probably the way we
will have to deal with it.
[except for the "whining baby" issue, see summary at end]

> Neither propagation nor ease of construction has much merit in this argument.
> Commercially, propagation problems are easily addressed by relay stations.
> Ease of construction, besides not being a commercial concern, is a totally
> bogus argument. As most microwave enthusiasts will tell you, given the
> proper tools, nice little stripline circuits using surface mount components
> are vastly easier to build than big hulking HF equipment that requires

> a lot of mechanical work and machining. And it's a bunch easier to build
> a 30db gain antenna at 10 gig than at VHF. Tuning circuits is much easier
> when you can make gross changes by adding or removing bits of trace metal.

And if we could get the code-addicts out of our hair, we could get more hams
interested in microwaves (who just happen to not be interested in trying to
learn things they won't use and will forget).

> Ease of understanding the principles involved might be an issue but if
> we raise that one, we are tacitly admitting we are a bunch of dummys.
> Then we have to explain our failure to train a cadre of operators or
> to advance the state of the art.

We are dummys... as long as we expect CODE to be the way to ham radio.
But that's part of the "codeless option" issue you and I already agree on.

> > You must be careful again. What is your idea of moderization, no-code ?

> if I had not gotten my license years ago, I sure would not now. If
> no-code ever happened, I'd participate; if not, well I've got a bunch of
> equally enjoyable things to occupy my time.

You obviously can see the problem is that the code-addicts are (mostly) of the "you better do like me, be like me" type. Even I have a hard time facing it at times, but I know I have to because that's the way the world is. If ham radio is going to remain entirely traditional, then the next generation is only going to be reading about it in historical reviews published by the American Radio Heritage League.

> In any of your examples, ham radio had better have some justification
> other than a desire to work DX pileups for keeping the band(s). If not,
> we'll loose them too.

We can justify working DX today only in terms of keeping our radios and skills in working order (including CW if that person is so inclined) just in case of emergencies. In days gone by, we were learning about radio propogation. These days we already know as much about it as we know about the weather.

> Let me throw out a little kicker to think about a bit. We continue to act

>
> Think about it again.

Yep... as long as the code-fuss issue is around, we can't fight the FCC on
the other issues, because we DO come across as a bunch of whining babies.

Maybe my idea of a separate Experimental/Emeregency Service that takes all
the VHF/UHF/SHF/EHF frequencies with them may very well be the only way to
save even a portion of those bands (if we don't come across as whining again
on that issue).

>outright operation; you just have to ask.

We've been around this one in rec.ham-radio before. FAR 91.19 applies to
all electronic devices, and specifically prohibits the pilot of an air
carrier-operated aircraft from having the authority to grant permission.

1710. Re: HT's and Airlines question

Newsgroup: rec.ham-radio
Date: 1989-07-23 14:42:18 UTC
From: john@anasaz.UUCP
Message-ID: <441@anasaz.UUCP>
Source record: 17834

In article <20658@cup.portal.com> Wiley_M_Sanders@cup.portal.com writes:
]It is legal to operate a battery powered scanner, radio, etc. on board
]an airliner as long as it is dome with the permission of the captain
]of the aircraft. No regulation prohibits carrying one on board, or
]outright operation; you just have to ask.
This is simply not true. By current FCC regulations, you have no
problem. However, the FAA prohibits you from using any non-type accepted
(or whatever the FAA term is) radios on board any plane flying IFR.
Since airlines always fly IFR, you cannot do it. The captain of the
aircraft is often un-aware of this regulation.
With the new "plain English" ham rules about to be enacted,
operation of amateur equipment is explicitely prohibited on any
IFR aircraft. The FCC did this to support the FAA rule since there
has been continual confusion about this issue on the part of hams.
By the way, this means that if you are over 18000 feet and you
are operating a radio, and you are not in a balloon or glider, you
are illegal.

1711. Residential telephone rates for repeaters

Newsgroup: rec.ham-radio
Date: 1989-07-23 17:55:40 UTC
From: 17158EJG@MSU.BITNET
Message-ID: <12517158EJG@MSU>
Source record: 17835

Being a control op for our club's repeater, I was really excited when I found out that some clubs had succeeded in obtaining residential rates for their repeaters. I read about it in QST (someone asked for the issue a few posts back, and I looked in all the issues of QST my Dad had in "the shack" [back to January of '88] in the "FM/RPT" column for the issue I read it in. I didn't find it, but I did notice one issue was missing - probably I loaned it out for the same article. Anyway, it might be worth a look to check the March '88 issue of QST just in case.)

Anyway, after reading the FM/RPT column, I called up the other control op and told him we should call up Ma Bell and complain, saying that because the FCC (which has more power than Ma Bell in my opinion) says that amateurs are not allowed to use the amateur service for business purposes, we should not be charged business rates (even though we are located in an insurance company's headquarters.) After a few phone calls to various people in the phone company, we _DID_ get residential rates - the only thing was that the phone bill now goes to one of the control op's own house, in his name, instead of to our club's P.O. Box. Why that makes a difference I don't know, but the unlimited local calling of residential service is nice (and cheap!)

So I'd suggest anyone who is in the situation to try it, it can't hurt, and in our case, it worked.

1712. ACC RC-850 Users/Owners Group?

Newsgroup: rec.ham-radio
Date: 1989-07-23 18:07:35 UTC
From: 17158EJG@MSU.BITNET
Message-ID: <12617158EJG@MSU>
Source record: 17836

Our club uses a decked-out RC-850 controller, complete with a 1-meg Digital Voice Recorder and the new Computer Interface from ACC.

Being one of the control op's for the repeater, I try to use as many features of the 850 as possible - including the scheduler, which allows us to keep the repeater from getting "too monotonous" by changing ID's and stuff throughout the day. I also try to come up with "clever" voice ID's using Romeo and Juliet, the built-in speech synthesized voices. So.... What I was wondering is how many "net readers" out there use (or own) an ACC-equipped repeater? I'd like to get some ideas for different ID's, which can be tough with the limited vocabulary. (Although the Computer Interface brings it up to 530 words, although most of the new ones are weather and public-service related.)

Anyway, if you have heard some interesting ID's from area repeters, (even if they're _real_ voice, we can still do them on our DVR, but we try to keep it as "free" as possible for voice mail) then send me mail with their ID's. If the response is good enough I'll post a summary to the net after I get a bunch, including all the ones we use/have used.

Sincerely,

1713. Any one remember the United States DX Association???

Newsgroup: rec.ham-radio
Date: 1989-07-23 20:33:16 UTC
From: root@mjbtn.MFEE.TN.US
Message-ID: <492@mjbtn.MFEE.TN.US>
Source record: 17837

I was just wondering if any readers out there (HAMs or SWLs or both) remember a club that operated out of Alanta, GA, called the United States DX Assoc.? It also used to be known as the Southern DX Assoc until it merged with Association of Illinois DXers (AIDX) and the Altantic States DX Assoc (ASDA).

If any recalls this organization, I would very much like to hear from you. I used to be involved with it a long, long time ago, but was out of it at the time it went bust somtime in late 1982. I wanted to see if anyone else remembered it. It sort of went the same way as the Dixie DX Club that operated out of Louisiana in the late 70's.

Please email all correspondence as I would hate to waste further bandwidth on this trivia question! :-)

Thanks in advance.

Mark.

1714. Re: HTs on airplanes

Newsgroup: rec.ham-radio
Date: 1989-07-24 08:11:45 UTC
From: hugh_davies.WGC1RX@XEROX.COM
Message-ID: <890725-192353-219@Xerox>
Source record: 17838

Joseph Skoler <SKOHC@CUNYVM.CUNY.EDU> asks about carrying HTs on airplanes. Here's my experience, for what it's worth.

A couple of months I flew British Airways from London Heathrow to Philadelphia and back. At Heathrow I put my shoulder bag, which contained my FT290 and a *LOT* of camera equipment through the X-ray. The security people didn't like the look of the X-ray, so pulled me out of line, then wanted to see inside every piece of kit; cameras, lenses, and inside the FT290. They wanted to know what the '290 was, and when I explained it was an amateur radio transceiver, they called the supervisor. He asked to see the rig switched on, then said "Oh, if it's ham gear, that's OK, but you must go to the airline desk and check with them". He didn't ask to see any proof that I was an amateur. I checked at the BA desk, and they said I should remove the batteries from the rig to prevent inadvertent operation. I didn't do that, but I didn't switch the rig on in flight, either.

Coming back through Philadelphia was a completely different situation. It was the most pathetic "security" check I've ever been through, and I've been travelling regularly for my employers (look at the email address!) for 10 years. The X-ray machine was broken, so they were hand checking all the baggage. The guy just looked at the top of my shoulder bag without removing any of the contents. The '290 wasn't even mentioned. When the zips on my parka (hiking in Pennsylavania in February!) set off the metal detector, they just passed it to me round the machine. I could have got a Kalashnikov and 200 rounds of ammo on that plane. Sigh.

I guess what this means is that there are no hard and fast rules. It varies from airport to airport, and from day to day, and depends which line you get in. In Europe the best check appears to be at Paris Charles de Gaulle, with London Heathrow second, and the worst at Milan Linate. Philedelphia was a long way worse than that.

Have a nice trip.

73, Hugh, G0CNR.

Regarding 6 meters: (transverters, amps, etc.)
There are several good tranverters on the market. Probably
the best is the Microwave Modules MMT50-28R, which I think does
10 watts and has a GaAsFET front end. These can be bought from
several vendors [but stay away from Spectrum Comm. - they're crooks].
Now regarding the ICOM IC-735 as an IF - it will be difficult.
Every ICOM HF rig that I have seen has VERY low 28-MHz output from
its IF jack, usually less than 1 mw and this is not enough.
I would suggest that, rather than fiddle around, that you 1) trade in
the ICOM for a Kenwood TS680 (HF + 6 m), or buy a serious 6-meter
rig like the IC-575.

Source record: 17840

Greetings net,
Jim Walsh W7LVN in Eugene, Or was one of the local folks that I am aware
of who has successfully put an autopatch on a commerical site using home
phone rates. One of the main bell companies (could it be Mountain Bell??)
made a decision that since FCC regs prohibits commerical traffic on amateur
frequencies, it was ok to charge home rates for the repeater line even though
it was located in a commerical site! I would suggest that you contact Jim
for more details (sorry I don't have his phone or address here at work).

^^^^^^^^ ^^^^^
I believe you would see the effect much more as a _deeper_ notch! If
you want to take advantage of the higher Q available in lower-loss
coax, you should do something to put in a pole near the zero that
the stub gives you. It doesn't have to be very high q. They cancel
each other out when you get a ways away from the pair.

Yes, I had an experience with this. Cop was using X-band (10.525 GHz) coming toward me (as indicated by my radar detector). I was transmitting on 2m. Sure enough, he came around and said he had clocked me at 68, and I *KNOW* I was not going over 57.

I pointed out the fact that I was a ham, transmitting, etc. and suggested a little experiment, which he agreed to (while he wrote the ticket). I stood stationary and keyed my HT about 100ft. in front of his car, and his radar registered 83 MPH! (no other traffic around).

He still gave me the ticket "since it was already written". I was just passing thru the state (Colorado) and asked what I had to do to fight the ticket. Well, it was some little hick town, and the judge was off fishing for the weekend (really), so the cop said I would have to spend the next 3 days in the slammer or pay the fine & return. Since he mentioned that the fine must be paid then and in cash & he had to register the serial numbers on the ticket, we scrounged up the entire fine (~$33) in $1 bills. >:)

Moral of the story: keep of the radio when the cops are around with radar.

>...
>--Phil howard-- <phil@ux1.cso.uiuc.edu>

Unfortunately, having some of the local officials involved and informed
may not be enough. Here in Boulder County (you all remember Bummer County,
I'm sure? Where you can have a 200 foot silo for your grain, but only
a 50 foot antenna, and only one antenna) the hams actively support
the County via BCARES (Boulder County ARES). During the Sugarloaf fire
a short while ago, the communication person for all the county remarked
to me just how much he appreciated the job the hams did, and how much
we were needed.

However, a few special-interest groups managed to convince the County
Commissioners to slap hams in the face. They also managed to convince a
federal judge (who just happens to live in one of the more expensive
neighborhoods in Boulder County) to ignore the comments she herself
(the judge) made about what the county had to do to meet the requirements
of PRB1.

But, in any case, PR is something we need to work on more, even if
it is not the complete answer.

1722. ARRL Board supports limited no-code license

Newsgroup: rec.ham-radio
Date: 1989-07-24 17:28:32 UTC
From: karn@jupiter.bellcore.com
Message-ID: <17274@bellcore.bellcore.com>
Source record: 17843

Here's a message I received via Compuserve, courtesy of WB2D:

W1AW BULLETIN
The ARRL Board of Directors met Friday and Saturday, July 21 and 22, in Windsor Locks, Connecticut. After extensive discussion, by a vote of nine Directors in favor to six opposed, it was agreed that a proposal recommending a codeless class of amateur license will be presented to FCC in the form of a petition for rulemaking incorporating the following elements.
The examination will consist of element 2 and an expanded element 3A having additional questions, including ones related to Morse code.
License examinations will be given through the VEC examination system.
To upgrade to Technician, the new licensee will pass a five word per minute Morse code test administered through the VEC system.
Call signs shall be assigned from the Group D call sign block.
Frequency privileges shall be 220 MHz and above, with output power limited to 250 watts.
The licensee shall not be the control operator of a repeater or auxiliary station.
While there was concern that there might be confusion with an unpopular FCC proposal in 1974 to create a new class of license called Communicator, the Board felt this was the most descriptive name for the new license class. The ARRL proposal is similar to the abandoned FCC concept in name only.
In another important action, the Board adopted a policy to oppose any fees for Amateur Radio station and operator licenses that exceed either the actual cost of administration, or the fees charged for any other licenses used for non-profit purposes. It pledged to oppose any fees for license modifications or upgrades, except those used to reimburse VEs and VECs for their expenses, and to oppose fees for reciprocal permits or for RACES, military recreation, or school club licenses. In the fight, the League will be using the Capitol Hill resources it developed in the effort to defend 220 to 222 MHz.
Other actions taken by the Board at this meeting will be announced in a subsequent W1AW bulletin. AR

> It is legal to operate a battery powered scanner, radio, etc. on board
> an airliner as long as it is dome with the permission of the captain
> of the aircraft. No regulation prohibits carrying one on board, or
> outright operation; you just have to ask.

This is totally incorrect - all radios (both receivers and transmitters)
are prohibited by federal regulations, and the crew is specifically prohibited
from granting the permission. Below is a copy of the regulation.

FAR 91.19 Portable Electronic Devices

(a) Except as provided in paragraph (b) of this section, no person may
operate, nor may any operator or pilot in command of an aircraft allow
the operation of, any portable electronic device on any of the
following U.S. registered civil aircraft:
(1) Aircraft operated by an air carrier or commercial operator; or
(2) any other aircraft while it is operated under IFR.
(b) Paragraph (a) of this section does not apply to:
(1) portable voice recorders;
(2) hearing aids;
(3) heart pacemakers;
(4) electric shavers; or
(5) any other portable electronic device that the operator of the
aircraft has determined will not cause interference with the
navigation or communication system of the aircraft on which it
is to be used.
(c) In the case of an aircraft operated by an air carrier or commercial
operator, the determination required by paragraph (b)(5) of this
section shall be made by the air carrier or commercial operator of
the aircraft on which the particular device is to be used. In the case
of other aircraft, the determination may be made by the pilot in
command or other operator of the aircraft.

The intend of section (c) above is to forbid the pilot of an airliner (i.e.,
an air carrier aircraft) to make the determination, only the company can make
this determination. This interpretation of the regulation has been verified
by the FAA Air Carrier District Office at JFK airport.

The only times that the pilot CAN do this is for non-airline, non-commercial
general aviation flights. For airline use, only the "air carrier" (i.e.
the airline) can do this.

>CODE OPTIONAL Service, where Morse Code still plays an important role.
>...

I currently am planning on getting my upgrade sometime simply because I
have a friend in Tucson with whom I would like to talk over Ham Radio.
So, I've got to start all over again learning the code. Which I expect
to promply forget again once I've passed the test. Not plan, but expect
since I do not at this point expect to be doing much code with my friend.
Packet, maybe. Code? Doubtful. I'm not going through the code to use it,
just to pass the haz.. umm, requirements :-).

Well, thats just my situation, so those of you who are anti-no-code (or
pro-code-always, as you prefer) can see that a codeless option in ham radio
will not mean the loss of code skills any more than the current licensing
structure does :-), since I'd upgrade regardless of the code-free option,
and since I'd promply lose my skill regardless, just as I have already done.

Seems to me I already said this once. Hmm. Maybe its time to drop out of
the code optional debate for a while once again. Yeah, thats it!

Responding to Will's question:

The reason people want to know what the current call signs are is to
determine if they'd like to change their call sign on an license upgrade
or keep their current call instead.

For example, I'd like to change my call to an advanced class call, but
I don't particularly like the current call prefix in the 7 area. So
I'm waiting until the prefix changes to KG7xx from KF7xx.

Hope this helps.

Also, thanks to all that have sent me e-mail regarding the phone number
for the FCC and BBS's that have the info.

73,
Barry Kurtz

> The ability to copy code at 5 WPM is trivial, IMO. What I meant by "earn" is
> not the final ability to copy code at 5 WPM, but the dedication and
> commitment it takes to learn it.

I agree that the ability to copy code at WPM is trivial (for almost everyone) since I also found it to be so when I learned it.

The issue presented as "no-code" is to allow to be licensed, those people who feel it is better to "earn" their license with dedication and commitment to the radio theory, operating practices, and regulations that apply to the particular aspect of ham radio they are interested in. There are a lot of people out there who would be dedicated to these things, if we were not trying to haze them with the Morse Code that they are not interested in and do not need for the aspects of radio they are interested in.

Some people are so dedicated to ham radio, they will do ANYTHING for a license. The number of such people, unfortunately, is very low. There are, however, a number of people who are sufficiently dedicated to becoming hams that they are willing to study and to learn what is necessary and applicable. The problem is that some of us (the code-addicts and the i-did-it-so-they-can-too types) are wanting to block out those whose interests happen to be in those parts of ham radio that do not need a Morse Code skill.

>From: jerry@qvax2.UUCP (Jerry Gardner, NJ6A)

> hard to learn code at 5 WPM.

There are a lot of these "code really was easy for me so it should be easy for everyone else" stories. I have told my own already. However, the fact that there are ALSO a lot of "the code was real hard, but I stuck with it and got it" stories shows that whether code is easy, or code is hard, it is just not universally the same for everyone. Everyone is different. Just don't try to make everyone the same (as you).

>From: jerry@qvax2.UUCP (Jerry Gardner, NJ6A)
> This I agree with also. I think the theory requirements should be not only
> kept, but also strengthened. I'm appalled at how simple some of the theory
> exams are, but I guess this is just a reflection on how much our society
> values technical prowess.

The code test, in part, stands in the way of further strengthening the written exams. One reason is that some of the study time is used to learn

code, when it could be used to learn theory. If someone is learning to be a CW operator, this is the way it should be. At the present it also applies to all HF privileges, and the current (sane) proposals do not suggest to change this. They only ask for a new VHF/UHF/codeless class.

>From: jerry@qvax2.UUCP (Jerry Gardner, NJ6A)
> At the same time, I believe we should also retain the code test. The theory
> exam will demonstrate an applicant's knowledge, the code test will
> demonstrate his determination and drive.

Why do we need to test determination and drive? That's just hazing under another name: "you wanna be one of us, eh?, well you gotta do THIS first!". WE hams do NOT own the radio spectrum we use. It is PUBLIC. If we want to haze people, haze 'em to get into the ARRL or something. This is a totally inapproriate attitude for access to a PUBLIC resource.

The code test is NOT a fair way to do this, because it gives those people who are interested in code an easy way in.

Yes, it a way it *IS* happening now. Everyone can easily get the exams, which is the only fair way to do it. We do need to clean up the examination process and the exams. They need to test an understanding of radio, not one's ability to memorize. Do you have any specific suggestions?

A lot of hams do. A lot of hams don't. Yes, ham radio is "broken" and it
certainly does need fixing. The code test is getting in the way.

Ham radio is much to diverse for anyone to be involved in all of it.
Not everyone can get involved with code.

CW should be a choice, not forced on people. Back when ham radio WAS CW,
this made sense. WAKE UP!!! It's 1989 already.

> > There have always been LIDS and always will be, no testing will change that.
>
> So let's fill the bands with them so the ones we have now will not be lonely?

Another case of KA9Q's "straw man" accusation. KN7B wants to believe that
the codeless license class is going to bring in all kinds of LIDS, so that
he can force everyone back to his beloved code.

What should have been said was "everyone barrel has its bad apples". Testing
can be improved to reduce LIDS. The CW test won't make any difference one
way or the other. LIDS got in past CW anyway.

True, and probably even legal for the pizza parlor to do, as long as all they
do is listen.

> But in the autopatch case, the PURPOSE of the call is not really to facilitate
> business affairs of pizza parlor operator. The PURPOSE is to facilitate
> the personal affiars (ie. save the time of) the individual placing the order.
-------- -------
> A transaction involving a pizza is business only for the seller. (By contrast,
> the purchase of a car or stock would probably be construed as business for
> both parties.)

Not quite. It is COMMERCIAL business for the pizza parlor, but it is still
"business" for the buyer as well. Suppose I happen to have a frozen pizza
in the freezer, and you wish to buy it from me. It would be business for
BOTH of us if the deal was done. Suppose instead I have a radio receiver
for sale and you want to buy it. Again, the actual buy/sell deal is
business for both of us. Neither case falls under "commercial" but they
both fall under "business".

> While the pizza parlor will make some money from the fact that the HAM used
> amateur radio, this is an EFFECT of the call, but not its INTENT. When HAMs

> that's not OK.

I agree here.

> To be fair, I'm NOT an attorney, and even I think my interpretation is
> narrow as can be, but I still read it as legal, if just barely.

We are not that far off, since I think it is ILLEGAL, but just barely.
The difference here is that we do not agree on the scope of what "business"
is.

Let me put forth this argument: why would the FCC phrase the rules like:

97.113 Prohibited transmissions
(a) No amateur station shall transmit any communication the purpose

of which is to facilitate the business or commercial affairs of any
-------- == ==========
party. No station shall transmit communications as an alternative to
other authorized services, except as necessary to provide emergency
communications. A station may, however, transmit communications to:

[(1) and (2) specify some unrelated areas permitted]

Note the underlined portion. The implication I read from this is that
business of a non-commercial nature (to the ham ordering pizza for instance)
is still prohibited because it is business. We think we are just getting
something to eat, but in fact we are doing more than that, we are making a
deal with someone to provide us with a service (to make, cook, slice, and
possibly deliver the pizza) and to top it off, arranging to make financial
exchange for doing so. It's business in my book.

> With the new "plain English" ham rules about to be enacted,
---
That was an earlier attempt that did not go through. 88-139 (see
Federal Register Vol 54 No 117 (Tue June 20) page 25857) is a
reorganization. Some phrasing was changed, some rules were dropped
and some were added. The major emphasis was a cleaner and more
organized set of rules.

> operation of amateur equipment is explicitely prohibited on any
> IFR aircraft. The FCC did this to support the FAA rule since there
> has been continual confusion about this issue on the part of hams.
> By the way, this means that if you are over 18000 feet and you
> are operating a radio, and you are not in a balloon or glider, you
> are illegal.

Just in case anyone is wondering what you are talking about:

97.11 Stations aboard ships or aircraft
(a) The installation and operation of an amateur station on a ship or
aircraft must be approved by the master of the ship or pilot in command
of the aircraft.
(b) The station must be separate from and independent of all other radio
apparatus installed on the ship or aircraft, except a common antenna may be
shared with a voluntary ship radio installation. The station's transmissions
must not cause interference to any other apparatus installed on the ship or
aircraft.
(c) The station must not constitute a hazard to the safety of life or
property. For a station aboard an aircraft, the apparatus shall not be
operated while the aircraft is operating under Instrument Flight Rules, as
defined by the FAA, unless the station has been found to comply with all
applicable FAA Rules.

I wonder what else it will sense. What will the Provincial Police do when
they detector-detector goes off on a car that they cannot find a detector
in, and when they test again, it fails (to now show one).

What do they do with all those detectors? Is there a way to make them no
longer usable as radar detectors, but be usable for ham radio projects?

Dear all,

Why don't radios, including ham radios, use dolby systems?
Is dolby for tape recordings only? If not, would using
dolby for radio transmission improve audio quality, assuming
that both transmitter and receiver have dolby capability?

I've been plagued by speech processors lately - I never use
them myself, but do have difficulty understanding those who
overuse it. If dolby is a possible solution, I want to look
into it.

Any info most appreciated.

Yeah, right. "Gee, I've paid my $30 for the year, I might as WELL order a pizza via the autopatch! I've EARNED it! Gee, maybe I can rent my rig out to a taxi company and get back that money, too..."

There just isn't any way to judge interest and/or dedication except by measuring interest and/or dedication. But if you'd like to have something to try with, maybe the examination should include "Bring a transceiver you have designed and built; explain it; operate it."

Greetings from Toronto:
Over the past couple of years, more and more airlines are adding
in-flight telephones. You know... the ones that you put your VISA card
into, and then you walk back to your seat the long way so that everyone
on the flight can see that YOU are using the phone... Then, when you get
back to your seat, you call the person that just dropped you off at the
airport a half hour ago and say "Guess where I calling you from..."
Well you get the idea. Anyway does anyone know what frequencies these
phones use, and how they work?
Just curious.

PS: I confess... the call cost ME $18.

Alan Kennedy

> which can be tough with the limited vocabulary.

99% of the repeaters in America must use ACC controllers; I mean,
every frequency you tune to nowadays tells you the time, frequency,
temperature, humidity, radiated power, phase of the moon, etc.

I guess having cute IDs on a repeater is much like vying for
neatest signature lines on USENET.

Since I am convinced that less is more, my favorites are:

"Get high on smoke..."

and

"Get nude and party at three..."

followed by the usual callsign b.s.

I purchased a TS440S/with AT about two months ago. I also purchased 450HZ CW and
2.1KZ SSB filters from International Radio. I'm very pleased with the operation
of the radio and its hot front end (better sensitivity than my TS820).
The programming of memory channels is not very straight forward. I still don't
know how to use all the memory functions. I enjoy CW and have found the IF shift
and optional filters to do a good job of eliminating adjacent QRM. I did a lot
of research before buying the TS440 and didn't want to be trapped into buying
the same model I already owned just because of familiarity. I would still
purchase the TS440 but would recommend the Kenwood optional filters only
because the International Radio filters are a little strange to install.
A final note: If you're considering the built-in antenna tuner and don't have
an antenna system that matches to 3:1 without a tuner, the build-in unit
won't match it. I'm sorry I bought the AT. I hope this is helpful.

By the way my second choice would have been the ICOM 751.

I have a TS-440 since October, and love it. I have had absolutely no problems
with it at all, so I can't give you any input about the quality of service,
or the lack there of. I have no dislikes about the radio - in a recent
field day operation, I had the chance to use several other rigs, which gave
me an even greater appreciation for the 440. I would recommend the 500 hz
cw filter if you operate cw or fsk, I have the narrow SSB filter and almost
never use it - I find it almost worthless. I bought the computer interface,
it works well but you can put one together yourself for a lot less. I am
currently using the interface for autologging (I wrote my own), but
you can also turn the rig into an unlimited memory receiver. Anyway, if
you have any specific questions about the rig, please ask.

I saw your question about the Kenwood TS440 on the DIST-HAM echo over BITNET.
My TS440 has worked fine for two years now. I don't have the builtin trans
match nor have I added the RS232 computer interface. The direct keyboard
frequency entry and 100 VFO memories is nice. The only thing I may do in the
future is install some narrow filters.

I had one for a couple of years and loved it. I kinda missed not having
160 meter functionality on the automatic antenna tuner, but since I didn't
use 160 much, it didn't matter (maybe I didn't use 160 much BECAUSE the
automatic tuner didn't cover it - I don't know).

I used it on packet alot - had two ports on my UNIX machine dedicated to
it - one for the TNC, one for the RS-232 control. Worked great!!

I'm kinda sorry I sold it, but toward the end (just before I sold it), I
think I may have used it about an hour (in the last six months) on 10 meter
FM that was fun.

I unreservedly recommend it.

Message-ID: <8907250133.AA05007@ee.su.oz.AU>
Source record: 17863

There are alot of messages regarding radar detectors being falsely triggered. I am wondering about the alternative, is it possible to cause the radar detector not to trigger when a car is speeding?

The obvious method would be to retransmit a signal in the K and X band regions at a slightly lower frequency, but this could be constituted as willful interference.

But say I had a very good reflector mounted on the back of my car and that this reflector was constantly rotating in a way that waves would be reflected back at a lower frequency would this be legal? would this be considered interference (since I am not transmitting)?

I once rode with a judge and he claimed that he had never seen a speeding ticket hold up in court when an expert was brought in to testify that radar units are not always accurate.

Disclaimer: The above is for curiousity and has nothing to do with the dream of rolling past a cop at 90 mph, and watching the cop scratching his head at the 30 mph reading.

I wonder what they do with them too. The new radar gun modules I've been buying
($40 for the doppler transceiver if bought on the Japanese surplus market)
work great for local oscillators for 10368 MHz SSB transverters. Also,
used by themselves to drive a 2' dish they are good for 20-40 miles on
ATV and 2 Mbps digital radios. The xcvrs in fuzzbusters and door openers
are almost identical and should have similar range.

I don't know about making them inoperable for radar but usable for
the lower 10-10.5 band though. Maybe promising to retune them lower would
be sufficient.

I kinda figured the ARRL would screw this one up. So what's new. I think we now need to follow thru with the HAMLICEN mailing list proposal. Phil Howard, can you reactivate the proposal for final discussion and then let's get it filed.

Phil Karn, perhaps you could take a copy of this proposal and submit it to the TAPR and AMSAT boards?

I personally would rather do nothing in this regard than have the crippled proposal the ARRL board adopted. Comments?

Using stubs to attenuate unwanted signals: I had the following situation: my brother has a scanner radio and he wanted to listen to some railroad frequencies around 160 Mhz. Problem was that a nearby 2m repeater on 19/79 would show up as an image on one of the railroad freqs. He was using one of my 2m antennas to feed the scanner. So, I made a stub trap. I found that if I made the stub trap 48.6Mhz, the 3rd harmonic 146.79 would also get trapped. My reason for doing this is that the bandstop region around 146.79 is narrower with the 48.6 trap vs. a trap with its fundamental at 146. So attenuation at 160Mhz is less. I made this trap at work, where I had access to a spectrum network analyzer, so I could see what's going on.

equasion for making stubs: open: length in inches
L=2953*K/freq Mhz

shorted: L=5906*K/freq Mhz

where K is propagation factor of the coax, typically 0.66
(look in the coax catalog, or in the ARRL handbook)

one way to adjust it: Make the stub a little too long, and trim very small pieces untill you trap out the offending signal. Use a stable accurate signal source to transmit (at low power!) at the offending frequency and put the stub in the coax feeding the radio from the antenna you're using (distance of the T connector in the coax from the radio to the antenna is not important, just put it at some easy spot). Keep trimming untill the offending signal fades out. Problem is if you trim too far, you gotta make another trap and start again! Or make a shorted stub and use a pin to make the short, trying different spots. Vary your signal source freq and radio up and down to see what freq your trap is currently at, to see what's going on. If you have access to a network analyzer, than you have an easier time making your trap!

OUCH!!!

Double OUCH!!!

I just got off the phone with the NTIS.

They had a "small price increase" last year.

Yeah, real small.

The entire FCC callsign database now costs $625 for the
high-density version (the one we got for $400 last year -
you don't want to know what the 1600 bpi one costs, its more).

Ouch!

Of course, if I wanted to keep up-to-the-month current, its 'only'
$325/month. :-(((((((EVERY MONTH.

And you cannot get the 'differences' unless you subscribe to the
monthly 'service'.

(Thats a service?)

Well, now I've got to figure out if I'm really up for this.

(And I thought last year was bad at $400)

I will be emailing everyone who was in last years thing,
as well as those who were interested/definate for this year,
as soon as I figure out which way to go...

Ouch.

> I suspect that it is spread spectrum (of sorts) which hits
>(swept) from 530 to 1600 kHz every 100 uS or so.

My understanding is that done with a comb generator driven by
10 khz which produces harmonics every 10 khz. The relevent ones are
selected with a bandpass filter that passes the AM band and then modulated
with a balanced modulator carrying the AM audio. This effectively AM
modulates every line in the comb.

The signal is then amplified in a linear amplifier for distribution.

> rig like the IC-575.

I used a 6 meter transverter (MMT50/28S) Microwave Modules with the IC735, and had to use the actual output from the final rather than the transverter output for the reasons you mention. The QRP people have a mod for the 735 to allow it to truly run QRP (by changing the ALC), and while this works for transverters, if you forget to set up correctly, you can kiss your transverter goodbye when you hit it with 100 watts in the front end.

I recently put the transverter in nec.ham-radio.swap as I purchased an Icom 551 at a local hamfest. after a few weeks of good workout (6 has been HOT)....I think the MMT transverter may be a bit more sensitive, but overall, the difference between a transverter and a dedicated rig is a wash...just a little less set-up time. The transverter actually puts out more power than the Icom 551....but nothing a good Mirage A1016 didn't cure on the 551...

> 3. Turn radio back ON.

I will trade the mod for VHF xmit for one to open up
UHF for recieve...I want to listen to UHF public
service (450-470).

To enable VHF transmit:

1. Open the radio such that the two halves open
like a sandwich.
2. Locate the internal lithium battery
3. Locate several solder pads to the left of
the lithium battery.
4. Just to the top left of the lithium battery is
ONE vertical solder pad. It is almost under the
top left edge of the battery.
5. solder a jumper accross this pad.

Notes:

The other solder pads do several things, none of which seemed
interesting to me: one set VHF band to 144-146, one replaces
2m band with 1260Mhz (would be nice if there was a 1260 Mhz
RF module available...), two others seem to disable the
squelches for the separate bands...etc. like I said, not
too interesting.

Also note that for some reason the automatic repeater shift
(- offset below 147, + above etc...) goes away when you
enable VHF xmit using this mod. I guess you can't have your
cake and eat it to. Oh well...

Ok, anyone have that UHF mod for me??? If you're too shy to
post it, e-mail it or snail mail it, or for heaven sakes
CALL me!

1749. Public perception of Amateur Radio

Newsgroup: rec.ham-radio
Date: 1989-07-25 23:18:29 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500094@ux1.cso.uiuc.edu>
Source record: 17873

Perhaps the BEST reason of all to have a codeless license class in the Amateur Radio Service is PUBLIC PERCEPTION of our use/waste of spectrum.

While a lot of people who would be hams, would be GOOD hams, do not just because the code test is required. This is NOT because they can't pass it, as they probably can and know it, but just BECAUSE it is required at all.

However, the worst effect of the continual code requirement is that the GENERAL PUBLIC, and in particular the land mobile industry and the FCC, will perceive the present Amateur Radio Service as an EXCLUSIVE ELITIST CLUB. We do not need that public perception. We can't justify our spectrum allocations, in particular our VHF/UHF/SHF spectrum is in high demand, as long as we are making the purpose of ham radio operators to serve the hobby itself.

Hams already have to explain to people that Amateur Radio is NOT CB. But wh

1752. The now defunct Moon beacon

Newsgroup: rec.ham-radio
Date: 1989-07-26 14:09:51 UTC
From: tiller@scr1.UUCP
Message-ID: <430@scr1.UUCP>
Source record: 17876
Cross-posted to: sci.space,rec.ham-radio

Regarding the transmitter that was left on the moon and
subsequently shut off due to budget constraints:

1) Can the transmitter be re-activated?

2) On what frequency was this beacon transmitting? At
what power level/radiation pattern/polarization?

3) Was it transmitting useful data? What format was its
data in?

4) Would the data be useful today? Could this signal have
been received by perhaps an amateur radio operator "ham"
or anyone with the proper equipment?

If the frequency of the beacon is not in the middle of a
currently used (important) band, and if the data would be
useful today, and if the signal could be received by amateur
radio or other interested parties, then I would like to see
the beacon re-activated. The data from it could be collected
and perhaps analysed by a group of interested parties. This
beacon could serve several purposes to the amateur community,
besides the value of the actual data such as:

1) A very good yardstick of the condition of the ionosphere
and magnetosphere. Assumptions regarding HF and VHF
propogation could be made from this information.

2) A challenge to antenna designers/builders and theorists
who "push the envelope" regarding new and radical designs,
and those of us who attempt to "advance the art of radio"
by learning more about the science of RF.

3) A draw for interest in amateur radio for young people.
Imagine showing a classroom of youngsters that a man-
made signal is actually emanating from the moon. This
would go hand-in-hand with the sattelite demonstrations
and packet connections. With the recent emphasis on
computer education in schools, a bit of early digital
communications history (the moon beacon) and an example
how computers can talk over the airwaves via modern packet
radio would help round out the big picture. Amateur radio
is considered a black art by most, much like computers were
several years ago. If youngsters could be shown that packet
is a tool that can be used to provide greater (private, non-
commercial) connectivity for their PC's, much greater interest

would be generated in the hobby.

p.s. Important in regards to frequency bands means in such a place as not to cause harmful interference to existing radio communication systems.

Enough rambling from an amateur tech. in training...flames ignored, intelligent discourse welcome.

>to 250 watts.

Wait a minute! Do I remember the correct speed of light or not? THis
calculates out that the 2 meter band would be excluded. I've never
heard any CW on 2 meters (except repeater IDs). It is to use this
band that I was thinking about getting a license. I guess I'll have
to study the code after all if this proposal is the one adopted.
I can't really see any valid justification for excluding 2m. Does
anyone else (other than just keeping the numbers down)?

1754. Marine VHF channel assignments

Newsgroup: rec.ham-radio

87 157.375 161.975 Ship/shore - telephone
88 157.425 162.025 IC *Ship/shore - telephone
88A 157.425 A *Intership

The channel usage marked with an asterisk (*) are from tables in Icom IC-M2 and IC-M55 marine radio manuals, and are probably fairly "generic", and subject to change in different jurisdictions. Other channel usage is from my station licence for the Canadian West Coast, and from things overheard on the air. "Your usage may vary."

Some of the "Port Operation" channels are used by towboats or commercial fishermen in B.C.

Channels marked (CCG) or (USCG) are for Canadian or US Coast guard authorized stations only.

Channel 70 is supposed to be reserved for a future selective calling system, but is (illegally) being used for intership communications (even by the RCMP!)

The letters under "area" mean:
I: International only (non-US) according to Icom
C: Canadian usage
A: American usage

Channels with an "A" suffix are simplex operation on the ship transmit frequency of an international duplex channel.

Canada uses a "B" suffix to denote broadcast (one-way) use of the shore transmit side of an international duplex channel.

The previous posting showed the duplex channels as "repeater". There are no repeaters (as hams know them) in the marine service (so far as I know). If you are willing to pay for a phone call, the telco might let you place a call to another vessel on the same (or different) channel, and so get the effect of a repeater.

> Why don't radios, including ham radios, use dolby systems?

>goh< (kawai@csli.stanford.edu [arpanet]) n6uok

Because Dolby requires precision matching of levels, and you
have no absolute level reference. Other schemes like dBx
that don't require this also wouldn't work because they still
require flat frequency response and no monkeying with the
dynamics by speech clipping circuits and receiver AGC circuits.
There is a system called Amplitude Compandored Single Sideband
(ACSSB) that uses a pilot tone to get around these limitations.
UPS will use it on 220 MHz. It has been used experimentally
on ham radio. I have heard tapes of it, and it works fairly
well; reduces listening fatigue on noisy signals.

Dolby is optimized for tape systems. It is essentially a multi-band compandoring system, with an emphasis on high frequencies, where most of the tape noise is. I don't think it actually has any effect below 3kHz, where the necessary voice communication information is, so using it on a communications system is a no-op.

The compandor concept is valid for communications, and is what ACSB (what UPS is going to use on the frequencies they stole) is all about. When you complain about "speech processing", what you are hearing is the compression half of compandoring. What is missing is the control signal and the decompression part. We hams missed the ball on that. Maybe in a few years surplus ACSB equipment will be available for what's left of 220 MHz! I doubt this technology will ever spread to HF.

Back in the late 70s, a number of folks who maintained the 146.88
repeater in Pittsburgh worked in broadcasting and would get some of
the local radio and tv personalities to do IDs. These were
collected and recorded on a standard broadcast audio tape cartridge.
If the repeater were in use, the normal CW ID would be used, but if
it were idle for a short time, it would ID with a selection from the
tape. One of my favorites was that of a person doing a fairly good
impression of Richard Nixon:
"You'll never hear an eighteen minute gap on the WR3AJN repeater!"

>Dear all,
>
>Why don't radios, including ham radios, use dolby systems?

Dolby is a variation on compression/expansion, which is used on radios.
The purpose of a ham speech processor is to compress out its dynamic
range within the speech bandwidth (300-3000 Hz). There's no real need
for expansion at the receiving end, since it's still intelligible.
However, some commercial SSB radios do use expansion; this is called
ACSSB and is what UPS has gotten the FCC to assign our 220-222 band for!
Note that ACSSB transmits a pilot (carrier) tone to use as a reference,
since mobile radio has fluctuating signal strength.

Dolby itself, or at least the popular consumer Dolby-B, compresses just
the treble (i.e., everything above 3 kHz, though I don't know the exact
values it uses). Thus it's irrelevant for speech. And since music is
verboten for hams, that's pretty much the end of it. Dolby is designed
for music.

I will point out again that the model of people "buying the test answers" for the written part also works for the CW part in the sense that like any college sophomore, I learned the code well enough to pass the test and the promptly and with malice aforethought forgot the code. That has not stopped me from contributing to the development of packet radio or the work done by the AMRAD group which eventually got us authorization to use spread spectrum systems.

The notion that there should be some number of required CW hours for renewal is astonishing. I would much rather see every driver of an automobile have to redemonstrate that they can in fact safely drive said automobile before license renewal. After all, it is noticably harder to kill someone with a 2m hand-held than an automobile, and not knowing CW doesn't contribute to any potential for lethality.

1763. ctcss on kenwood 721 main band (again)

Newsgroup: rec.ham-radio
Date: 1989-07-26 19:01:03 UTC
From: 31005_1650@uwovax.uwo.ca
Message-ID: <3235@uwovax.uwo.ca>
Source record: 17737

I am reposting my previous question due to the fact it confused numerous
people.

I was looking for ctcss on the main band of the kenwood tm721. That means
NOT tone encoding. I am looking for tone decoding on the main band. When
I listen to our local repeater (VE3MGI on 145.390-), I also hear two other
repeaters on the same frequency (s5 to s9 most nights). Our repeater has
a tone encoder. That means it put out a tone of about 114 hertz along with
the voice it retransmits. The 721 will not allow you to have tone decoding
(which is required on the rig side of comms.) in the main band. The A.B.C.
switching is not working out very well. I heard there was a mod to allow
ctcss in the MAIN band. If anyone knows of such a mod, I would be very happy
to receive it, along with many thanks from other 721 owners in the city.

2nd point: There is no way to store ctcss in a memory. You can store
a TONE frequency, but cannot store the fact that you want tone decoding
on that frequency. You have to manually turn it on each time you play
with the VFO. Try it! It will not remember CTCSS was 'on'. Both of
my 721's do it, as well as others that I have asked.

Example: Turn on CTSCC with a tone of about 114.3 Store that in memory
zero (0). Turn dial so that VFO is now at memory 1, then go back to memory
zero. It will have rembered the RF freq (145.390-) and the PL tone (114)
but ctcss will have been disabled!?

PS: Otherwise I like my 721s. --

>band that I was thinking about getting a license...

Yes, you're correct; the ARRL proposal would exclude the 2 meter band.
This should not have been too much of a surprise, with the usual
justification being that two meters is already "too crowded" to
support more users. Of course, why a no-code licensee should occupy more
space than an operator who knows code is something that has so far escaped
me. Seems to me that if crowding on 2m is a concern, the ARRL should prohibit
ALL future hams from this band.

I presented a motion to both the TAPR and AMSAT Boards of Directors to
recommend including full VHF/UHF privileges above 50 MHz in a no-code
license proposal, and this motion carried on both Boards. Unfortunately
it seems to have had little effect on the ARRL.

The ARRL Board's attitude is just a little reminiscent of those who
grudgingly concede that desegregation is a good idea -- as long as it
doesn't affect THEIR neighborhoods or THEIR kids' schools. Not that
they're bigots, of course, it's just that their neighborhoods and
schools are already too crowded...

Here's a 'serial' type of ID. The guy around here with an ACC 850 did this around hamfest time.

To begin, he had an ID like this:

THE HAMFEST STARTS AT 9 A M ON 8 TWENTY FIVE BE THERE WB4ASZ REPEATER

This ID was on the repeater for quite a while, in fact a week or so after the hamfest. He therefore changed it to this:

THE HAMFEST STARTS AT OH THE HAMFEST'S OVER WB4ASZ REPEATER

Kinda gets your attention.

Another thing to try is to add some of the sound effects, like the bang or the "siren" It's real effective in scaring you at about 2 in the morning.

Hmmm... I don't suppose it could be as simple as transmitting
on the receiver's intermediate frequency, could it?

Back when car radios used "FET's with wicks", just about all
of 'em had the same IF (I think it was 262.5 kHz). I don't
know if contemporary units are so standardized.

In any case, if there is only one frequency in use, sending
a signal on it should get through to everyone.

It is very likely that either the power system is shutdown (or dead) OR
that they turned off any receivers that could be commanded to start the
transmitter again... and even if the receiver was working it would
cost too much to get the equipment and codings for the commands to
get anyone to move on it...

If anyone can Prove me wrong and get it turned it on, Knock your Socks off!
Go for it!... hihi

Glad to see FCC/ARRL are catching up with Europe/the rest of the world
by considering a no-code license. One question - although it may be a no-code
license, will it PROHIBIT the holders from using code? Here in the UK we had
a ban on 'class B' licensees (the no-coders) using code, until a few years
back, that was. Then the DTI (equivalent of FCC) agreed to allow the class
B license holders to transmit code as part of their practice to take the code
exam. It also helped show the class B people the benefits of code in the
weak-signal, high-noise situation.
The situation here and now is that irrespective of whether you are class 'A' or
class 'B' licensee you can use code in any band you are licensed for.
Shame the ARRL/FCC are proposing restricting it to 220MHz and up though -
why not allow them in certain parts of 2 and 6 meters too?
The RSGB here in the UK are proposing a 'Novice license' - low power on the HF
bands (or some of them at least) - as a way of getting new recruits to
ham radio - school/college kids and the like. Problem is, not all of them can
get the finance together for the latest Kencom TR789000 or whatever - still,
there are plenty of convertible CB sideband rigs about i guess.....!

You should be able to use a TV sweep/alignment generator rather than a
network analyzer since all you want to do is maximize attenuation at the
interfering freq., not measure the actual attenuation.

Obviously if you have access to a lab there is no problem, but if not
Heathkit swep generators run $5-$20 at hamfests.

I'm collecting information about policies regarding special Auto License plates for Amateur Radio Operators. I'm interested in getting information from all 50 States and all Canadian Provinces, and also from as many other areas of the world that can respond.

I'd appreciate at least one response from each area, so if you are willing to fill in the following questionaire with the most accurate information you can get and return it via E-mail (or USPS), you will receive credit when I summarize the results and post to the net (and possibly contribute an article to QST or 73, etc.) This may be interesting information for many purposes, including figuring ways to get better publicity for Amateur Radio. I'll periodically let the net know what areas have not yet responded, so that we can do a "WAS" quickly and efficiently!

Please feel free to edit the form of the questionaire to provide yourself with more room to answer the questions if you need.

Thanks,

Your State, Province or locale: _____

Does your State (or locale) have special automobile License Plates for Amateur Radio operators (also known as "Ham Plates")? Yes: _ No: _

Are these Ham Plates considered the same as other "vanity" plates:
By the registration authorities? Yes: _ No: _
By the law enforcement authorities? Yes: _ No: _

Excluding sales, luxury or excise taxes, what is the initial registration fee or charge for:
Ham Plates? _____
Other Vanity Plates? _____
Regular Plates? _____

How much is the renewal fee for:
Ham Plates? _____
Other Vanity Plates? _____
Regular Plates? _____

How long (the length of time between renewals) are the plates valid?
Ham Plates: _____
Other Vanity Plates: _____
Regular Plates: _____

How is renewal handled for these kinds of plates?
Ham Plates: Sticker: _ New Plate: _
Other Vanity Plates: Sticker: _ New Plate: _
Regular Plates: Sticker: _ New Plate: _

Can Ham Plates be used on any type of vehicle other than a standard Passenger Car (such as a light truck)? Yes: _ No: _

Can you get Ham Plates for other types of vehicles like Motorcycles, RV's, or Boat Trailers? Yes: _ No: _
If yes, what types of vehicles? _____

Do Ham Plates have border wording that indicate it is a plate for Amateur Radio? Yes: _ No: _

Do Ham Plates include any special symbol in the plate number (like a thunderbolt) different than that used on Regular plates? Yes: _ No: _
If yes, where is it placed in the call? _____

Do Ham Plates use the same colors as Regular plates? Yes: _ No: _
If no, what are the differences? _____

What proof does your local registration authority require in order for an applicant to get Ham Plates? _____
Is there any proof required to renew a Ham Plate? Yes: _ No: _

How long does it take to get Ham Plates? _____

In your area, where are license plates displayed on a vehicle?
Ham Plates: Front: _ Rear: _ Both: _
Other Vanity Plates: Front: _ Rear: _ Both: _
Regular Plates: Front: _ Rear: _ Both: _

What, if any, extra rights are legally allowed (like double parking for Doctors with MD plates) in your area by having Ham Plates?
_____

Does your area have other "special" license plates that are available to certain groups (like Veterans, Ex-pow's, CAP members, etc.) at a cost different from that of a Regular Plate? Yes: _ No: _
If yes, please list the categories and costs, if you know them:
_____

Are automobile insurance rates different for vehicles with Ham Plates or other types of non-standard plates? Yes: _ No: _

Have you confirmed the above information with local Motor Vehicle Registration or Law Enforcement authorities?
_ Yes, I called them up and confirmed it.
_ Yes, I asked someone who works there.

_ No, but I have the local rules right here in front of me.
_ No, I just wrote down what I remembered.
_ No, I asked someone else.
_ No, I'm just guessing. (in which case, please DON'T reply!)

Are you a Licensed Amateur Radio Operator? Yes: _ No: _
Do you have Ham Plates on your vehicle? Yes: _ No: _

Do you think Ham Plates are a good idea? Yes: _ No: _
Why (please elaborate)? _____

Might any of the information above change because local authorities
are considering changing the motor vehicle licensing laws to address
some political or financial problem? If so, please elaborate:
_____

Name: _____ Call: _____
I can be reached at: _____

Thanks for your help in gathering this information -- de N1EYZ

> calculates out that the 2 meter band would be excluded.....
> ....I can't really see any valid justification for excluding 2m. Does
> anyone else (other than just keeping the numbers down)?

I have several friends who will probably become hams should a codefree license become available. Without 2 meter access they will go out and get either 220 or 440 gear. As a result, I'LL get 220 or 440 gear, more repeaters will be put up, and we will be in a better position to ward off spectrum grabs in these bands. If they get access to 2 meters, they will buy 2 meter gear, and I would have less incentive to buy 220 or 440 gear. Assuming the codefree license will mean growth in the number of hams, I suspect the ARRL wants to direct that growth into the less used bands. Remember, UPS argued that 220 was underutilized, not that there were not enough hams.

...
> ENDORSEMENTS (examples):
...

I finally found a way to make this message readable (it took a little
dedication, and utility I could not find on UNIX).

Anyway, Mike, fundamentally, your proposal for a basic license and a system
of endorsements is a logical approach to the problem.

However, it is much too radical a change (sadly, having a class without code
is too much for so many hams already) for hams or the FCC to accept. These
are some of the reasons:

- How are people going to ready comprehend who has what privileges so
they (at least CAN) know what their fellow hams are allowed to do.
A lot of endorsements is a lot of things to keep track of.

- There will be a lot of little tests to take. Perhaps this is actually
good since each one can be more comprehensive, and it would ease the
burdon of becoming the ALL MIGHTY ham, by breaking the comprehensive
total exam into many stages. Still, it is a lot of tests for test
makers to bicker over.

- For the FCC, this means a tremendous new load of bureacracy. They
do not program their own computers, they contract out for it when
major changes are needed. This will be very costly to implement,
with the current state of affairs, expect it to add much to the
cost of a license when they finally do that. It might become $40
for the basic license and $20 for each endorsement. There goes
$220 for all of them, and then the $20 again every 10 years.

- Just what endorsements should there be and should there NOT be.
Should some be bundled together and others split apart. We might
arguing these for a long time, and ham radio needs a transfusion
TODAY.

Don't totally give up on the idea, though. Do keep it alive enough
to smooth out the details. In the mean time, though, let's start an

I.V. and respirator and try to keep the patient alive while we diagnose the problem and try to prescribe a cure; fight FOR getting a code-less license class (or classes (2) under the proposal posted recently (copies on request) HAMLICEN mailing list).

I've been informed my posting was truncated, and found that it had in fact been truncated somewhere between the notesfile system on ux1.cso and the news system on uxc.cso, here in uiuc.edu.

--------REPOST--------

Perhaps the BEST reason of all to have a codeless license class in the Amateur Radio Service is PUBLIC PERCEPTION of our use/waste of spectrum.

While a lot of people who would be hams, would be GOOD hams, do not just because the code test is required. This is NOT because they can't pass it, as they probably can and know it, but just BECAUSE it is required at all.

However, the worst effect of the continual code requirement is that the GENERAL PUBLIC, and in particular the land mobile industry and the FCC, will perceive the present Amateur Radio Service as an EXCLUSIVE ELITIST CLUB. We do not need that public perception. We can't justify our spectrum allocations, in particular our VHF/UHF/SHF spectrum is in high demand, as long as we are making the purpose of ham radio operators to serve the hobby itself.

Hams already have to explain to people that Amateur Radio is NOT CB. But what will people think about it when we tell them that it is required to study Morse Code to pass a test in it just to get the ham license?

What if these people are the ones wanting our spectrum, or deciding who gets what spectrum?

73's from KA9WGN

I am one of the people that Phil speaks of. I thought about becoming a Ham, and even joined the Rutgers Amateur Radio Club. I bought TITW, and even have a code program.

I started to learn code. I could pass Elements 2 and 3A in my sleep with a few hours study.

However, code turned me off completely. That, and the elitist "if you don't have a license, you are nothing" attitude of the Rutgers club. Many people have told me that "hams aren't really like that, this is just a bad group", but with this whole code/no-code discussion, I see that the elitism is the prevaling attitude. It seems to be similar to the fraternity hazing justification - "I went through it, so you must, to prove that you are worthwhile/qualified".

Code isn't needed these days. We have voice modes that are quite satisfactory on all bands, and computers that do code when it is required. The attitude I see is that code is necessary to keep out the riff-raff. Why not a stronger techincal test? I can't see many of the CB bandits learning how to build a Yagi to get a ham license.

So far, code, and the elitism of those who defend it, have kept me out of the hobby. I suspect that is true of many. I only hope that you remove the code requirement before most of the hams become silent keys.

Oh, I forgot. The ARRL proposal stinks of elitism as well. It shows a "keep these people off OUR band (2m), let them use the bands that WE don't" attitude.

That's just my opinion. You can pass it off as a minority opinion, or wise up.

The only problem with these kinds of sound effects and cute IDs is that the average person gets annoyed with them after a few days. Kind of like the car that talks to you, or appliances that talk to you. Most auto manufacturers have stopped selling speech synthesized devices because people become annoyed with them rather quickly.

I have nothing against an occasional clever ID, but some repeater owners with the new controllers want to put everything on all the time; filling the airwaves with a lot of sound effects and lengthy IDs. There is one here in North Carolina that goes on and on, saying something like this:

Don't touch that dial 03 is the only repeater for you with coverage for 100 miles this is W4XYZ repeater

(not real call and not 100% exact wording but you get the idea)

My point is that the announcement and other capabilities of these controllers can do many wonderful things (esp. with autopatch) but many repeater owners just overdo it.

ANARC CLUB LIST
=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=
```

Current to 26 July 1989

The Association of North American Radio Clubs (ANARC) was founded in 1964 to promote closer ties among radio clubs; to promote the interchange of information and ideas among member clubs; to work for the common good of listeners; and to provide a medium to speak out for radio clubs and listeners in North America. All the clubs forming ANARC are responsible volunteer organizations. No license is needed for the activities our clubs pursue. This list gives each club's areas of interest, dues and address.

From time to time, however, clubs adjust their dues or change their address. It is a good idea to verify the address and fees by writing to the club before sending money. If you want a reply, include a self-addressed stamped envelope with your inquiry.

```

All wave: Interested in all bands & types of stations.
Dues: Annual membership fee, including receipt of the club's bulletin. All fees are in US currency unless otherwise specified in Canadian currency (CN$). Overseas fees include airmail delivery of bulletin unless indicated otherwise.
DX: Long-distance reception.
FM: FM broadcasting (88-108 MHz).
Ham: Monitoring of Amateur Radio stations.
IRC: International Postal Reply Coupon.
LW: Longwave band (below 540 kHz).
MW: AM broadcasting (540-1705 kHz).
NA: North America - USA, Canada & Mexico.
PSB: Public service bands (police, fire, emergency medical, etc.). Generally 30-50, 152-174, 406-512 and 800-950 MHz.
Sample: Sample copy of club's bulletin.
SASE: Long self-addressed stamped envelope.
SW: Shortwave broadcasting (3-30 MHz).
TV: Television broadcasting.
Util: Utility stations (maritime, aeronautical and "fixed" services operating below 30 MHz).

1792. ANARC Club-Scan (July)

Newsgroup: rec.ham-radio
Date: 1989-07-28 08:38:13 UTC
From: rh@well.UUCP
Message-ID: <12894@well.UUCP>
Source record: 17766

**********| ANARC CLUB-SCAN: July 1989 |**********

Thirty-two people attended the * ALL OHIO SCANNER CLUB's * annual picnic in July, their biggest turn-out yet. ...Curtis Harbin is the new editor of the "American Scannergram" column for frequencies beyond Ohio and adjacent states/provinces. A contest is underway to pick a new name for it, and for Tom McElvy's computer column as well...

AOSC address: 50 Villa Road, Springfield, OH 45503 USA; US dues $15.00/year; Canadian US$18.00/year; sample bulletin $2.00 to No America, elsewhere 3 IRCs.
****

The giant spring issue of "Free Air" that went out to members of the * ASSN. OF CLANDESTINE ENTHUSIASTS * last month, included a report on George Zeller's appearance on a Cleveland radio talk-show to discuss pirates and clands; an article about US prisoners in a WW2 prisoner-of-war camp building a SW receiver out of scraps; Don Moore's review of a book about Brazilian free radio; a report by Don Bishop on pirate CBOR and their FCC bust last November; an introduction to the technology of TV piracy; plus the regular columns... The June bulletin contained John Arthur's directory of current addresses for "free radio" stations in North America...

ACE address: P.O. Box 11201, Shawnee Mission, KS 66207-0201 USA; US dues $16.00/year; Canada/Mexico US$17.00; elsewhere US$23.00; sample bulletin $1.50 to No America, elsewhere 3 IRCs.
****

The * ASSN. OF DX REPORTERS' * July newsletter ran the first installment of their worldwide guide to military shortwave stations--locations and callsigns. It will be serialized in the months ahead... Elsewhere in that issue there's a history of Australia's frequency/-time station, VNG...

ADXR address: 7008 Plymouth Road, Baltimore, MD 21208 USA; dues $17.00/year No America, elsewhere by surface mail $19.00/year; sample bulletin $1.00 No America, elsewhere 5 IRCs.
****

The * CANADIAN INTERNATIONAL DX CLUB * is sponsoring "the First Annual Montreal Shortwave Radio Festival" on July 22 at the Royal Canadian Legion Branch #94, 205 Empire St., in Greenfield Park, Quebec. Free and open to all from 9:00 a.m. to 2:00 p.m., there will be an equipment display with demonstrations, free promotional

literature, speakers on all aspects of shortwave monitoring, and radio books for sale. The annual CIDX Bar-B-Q follows at 3:00 p.m. at Sheldon Harvey's house, 79 Kipps St., Greenfield Park, Quebec. Cost for that event is Cdn$5 per person, and a nearby motel is offering a special rate for out-of-towners. For details and registration info, call Sheldon at 514-462-1459...

CIDX address: #61 - 52152 Range Road 210, Sherwood Park, AB, T8G 1A5 Canada; dues USA $25.00/year; Canada CN$26.00/year; elsewhere by airmail CN$32.00/year; sample bulletin $1.00 in North America, elsewhere $2 or 4 IRCs.
****

The May 23rd "L'Onde," published by * CLUB ONDES COURTES DU QUEBEC, * had a report on the annual meeting of Amitie Radio, France's largest SWL club; a French translation of our Feb 89 Forum on why there are so few women in ANARC's clubs; a review of the Grundig Satellit 500; an article about ties between Radio Farabundo Marti and community FM stations in Canada; a history of clandestine Radio Espana Independiente (1941-77); a page on Radio Zaracay, an FM station in Ecuador with the highest antenna in the Americas; commentary on the role of QSL collecting in DX clubs; a demographic survey of CIDX; plus loggings, schedules, press clippings, club news and letters to the editor...

COCQ address: 160 rue Prieur ouest, Montreal, PQ, H3L 1R5 Canada; dues CN$35.50/year, elsewhere CN$37.50/year; sample bulletin (all in French) NA $1.50; elsewhere 5 IRCs.
****

Ernie Cooper, co-winner of ANARC's 1988 award for "Specialty Band" DXing, won the * INTERNATIONAL RADIO CLUB OF AMERICA's * 1989 Ted Vasilopoulos award as "the person who has done the most for the club and the hobby"... Don Erickson is the IRCA's new treasurer... Ralph Sanserino is the IRCA Goodie Factory's new manager...

IRCA address: 6059 Essex St., Riverside, CA 92504 USA; dues USA $20.00/year; Canada/Mexico $26.00/year, write to club re other areas; No American trial subscription (10 issues + New Member Packet), $7.50; sample bulletin $.50 in No America; elsewhere 3 IRCs.
****

In the June "Lowdown," the * LONGWAVE CLUB OF AMERICA's * propagation editor Mike Mideke begins a series of articles on natural VLF radio emissions, describing propagation modes for lightning static, "whistlers" and "tweeks"... Elsewhere in that issue, Dave Wilson describes RTTY transmissions below 150 kHz, Steve McDonald profiles a 1615 kHz beacon in New Zealand, and Ken Stryker shares the latest on the Ground Wave Emergency Network (GWEN)...

LWCA address: 45 Wildflower Road, Levittown, PA 19057 USA; dues $12.00/year in No America, elsewhere $20.00/year; sample bulletin

$1.00 in No America, elsewhere 5 IRCs.
****

Sparks are really starting to fly in "DX World." In the * MIAMI VALLEY DX CLUB's * May bulletin, Tom White replied at length to Dave Hammer's editorial in the previous issue. Uncowed, Dave continued to press his argument that the American Radio Relay League--particularly one vice president--is hostile to shortwave broadcasters and listeners...

MVDXC address: 4666 Larkhall Lane, Columbus, OH 43229 USA; dues US$8.00/year; sample bulletin $1 in No America, elsewhere 3 IRCs.
****

Don Hosmer, the * MICHIGAN AREA RADIO ENTHUSIASTS' * founder, taped Radio Beijing the night the Chinese Army retook Tienanmen Square, passed the recording to local station WWJ, and as a result was interviewed on the air about shortwave listening... On August 19th, MARE members will get a tour of WKBD-TV.... Harold Frodge is the new publisher of the "MARE Members Newsletter." Bob Walker will take over Harold's mediumwave column...

MARE address: P.O. Box 311, Wixom, MI 48096 USA; dues $7.50/year in No America; sample bulletin $1.00, elsewhere 3 IRCs.
****

The * MINNESOTA DX CLUB * has a new mailing address for all club business: P.O. Box 3164, Burnsville, MN 55337... The annual MDXC picnic will be August 19th at Kordiak Park in Columbia Heights, a suburb of Minneapolis. Bring barbequables, plus US$2 to cover the club-supplied soft drinks & chips. For directions and reservations, contact George Sherman, 104 Pinewood Circle, Apple Valley, MN 55124...

MDXC address: P.O. Box 3164, Burnsville, MN 55337 USA; dues $10.00/year (membership limited to residents of Minnesota & western Wisconsin).
****

The * NATIONAL RADIO CLUB's * annual convention will be Sept. 1-4 at the Downtown Topeka Ramada. The cost, including banquet, for those who register before August 11th is US$26; after the 11th, it's US$30. Hotel rooms are US$41.80/night (1-2 persons) and the reservation deadline is August 17. To register write: Topeka DXCon '89, P.O. Box 5711, Topeka, KS 66605... Jerry Starr says NRC members with ham licenses meet Sunday nights on 3840 kHz at 8:00 ELT (moving to 3860+ if necessary to accommodate netters without Advanced Class licenses). Mediumwave DX and NRC info is discussed... DX Audio Service producer Fred Vobbe is now voicing the NRC reports and promos aired on HCJB and other shortwave stations...

NRC address: P.O. Box 118, Poquonock, CT 06064 USA; dues USA $24.00/year, Canada $25.00/year, elsewhere write to club; sample

bulletin $1 in No America, elsewhere 3 IRCs.
****

After more than a decade of standard-setting contribution to the * NORTH AMERICAN SHORT WAVE ASSN., * Glenn Hauser has been replaced as editor of "Listeners Notebook" by Bruce MacGibbon. Bruce has been editing a similar column for SPEEDX... In the June issue of "FRENDX," Roland Archer talks to Rich D'Angelo, Mitch Sams, and Dan Sheedy about "fundamental DXing techniques," while Ted Benson explains the function of antenna baluns...

NASWA address: 45 Wildflower Road, Levittown, PA 19057 USA; dues $18.00/year worldwide by surface mail (for airmail delivery of bulletin, write to club); sample bulletin $1 in No America, elsewhere 5 IRCs.
****

The * RADIO COMMUNICATIONS MONITORING ASSN. * is considering going to a larger magazine-type format for their bulletin... In the June "RCMA Newsletter," Dennis Biagioli reports on federal freqs in the Washington, DC area, Curtis Harbin compares the features of four scanners with 800 MHz coverage, Jay Delgado provides the major commercial broadcasting networks' security channels in New York City, and Bill Mauldin rave-reviews the new AR-2515 scanner...

RCMA address: P.O. Box 542, Silverado, CA 92676 USA; dues $18.50/year USA, elsewhere $22.50/year; sample bulletin $1.50 in No America, elsewhere 6 IRCs.
****

The * SOUTHERN CALIFORNIA AREA DXERS * had their annual picnic at the Huntington Beach Park on June 17th...

SCADS address: 3809 Rose Ave., Long Beach, CA 90807 USA; dues $10.00/year (membership limited to residents of southern California).
****

Here are the results of the annual * SPEEDX * Poll for 1989, minus a few categories and the runners-up (lack of space): Favorite international broadcast station, BBC; favorite tropical station, GBC-Ghana; favorite music station, Africa #1; best regional/local news, Radio Australia; favorite program, "Media Network"; favorite personality, Ian McFarland; station SPEEDXers would most like to hear better, Radio New Zealand; favorite Communist station, Radio Moscow; favorite interval signal, Radio Botswana; favorite QSL, Radio Australia; least favorite station, WYFR...

SPEEDX address: P.O. Box 196, DuBois, PA 15801-0196 USA; dues $20.00/year worldwide for surface delivery of bulletin (write to club for airmail rates); sample bulletin $1.50 in No America, elsewhere 8 IRCs.
****

Two dozen people attended the * WASHINGTON AREA DX ASSN.'s * annual cook-out on June 17th at Arlene Luskin's house in Silver Spring, Maryland, wolfing down burgers and franks as fast as Greg Monti could scorch 'em...

WADXA address: 606 Forest Glen Rd., Silver Spring, MD 20901 USA; dues $6.00/year (membership limited to area residents).
****

In the June "VHF-UHF Digest," Ronald Stock reminds members of the * WORLDWIDE TV-FM DX ASSN. * that "the last week in June and the first week in July are famous for multiple hop trans-Atlantic E-skip." So WTFDAns probably found Ulrich Onken's table of European TV carrier frequency offsets, elsewhere in the issue, helpful in guessing the origin of signals too weak to demodulate...

WTFDA address: P.O. Box 514, Buffalo, NY 14205 USA; US dues $17.00/year, Canada US$18, elsewhere $27.00; sample bulletin $1 in No America, elsewhere 6 IRCs.
.....

CLUBSCAN is a monthly feature of the ANARC Newsletter. Subscriptions to the Newsletter are $8/year to US addresses; US$8.50 to Canada/ Mexico; US$13 elsewhere. Order from: ANARC Publications, P.O. Box 462, Northfield, MN 55057 USA.

Dolby noise reduction would not be a good solution for HF communication noise.

Dolby was created to squeeze greater signal dynamic range from a medium. If you have a medium with 60 db dynamic range (the range between distortion and the noise floor) and you can squeeze in an extra 10 db with compression, then you can expand that 10 db back out at the other end to make the noise floor appear to drop by 10 db. The whole idea is to offer compression and still preserve the difference between the high level and low level sounds.

This requires that the expansion system used in playback be able to track the audio level accurately...which is not possible in HF communication with QSB.

If you were able to do it, the result would be that the system would insure that when you lowered your voice level momentarily, the signal level at the other end would drop without going down into the noise as much.

Instead we use speech processing on HF to eliminate any dynamic range. This way the audio level is always hot...varies little...meaning you can drive your amplifier hard without sending it into distortion.

It becomes a problem when it is not adjusted correctly, or when it is driven too hard. The distortion that comes form overdriving makes the signal lose intelligability.

1795. RE: Amateur Radio from the Space Shuttle

Newsgroup: rec.ham-radio
Date: 1989-07-28 13:32:37 UTC
From: parise%6168.span@FEDEX.MSFC.NASA.GOV
Message-ID: <890728083237.198@Fedex.Msfc.Nasa.Gov>
Source record: 17769

This is in response to the request for information concerning Amateur Radio activities from the Space Shuttle.

First of all the historical part of the answer. In 1981 (I think) Owen Garriott (W5LFL) carried a Motorola 2 meter HT aboard the Columbia on the Spacelab 1 flight (STS-9). He operated FM voice only and needless to say he work a whole lot of folks all over the world.

In 1985 Tony England (W0ORE) carried SAREX (Shuttle Amateur Radio Experiment) on the Spacelab 2 flight. SAREX consisted of that same HT but this time with a Robot SSTV converter. Tony engaged in 2-way slow scan TV QSO's with people on the ground in addition to voice of course. By the way there were two hams on that flight. John Bartoe, W4NYZ was also a member of the crew.

The next Amateur Radio activity from the Space Shuttle will be from Columbia on the Astro-1 mission currently scheduled for April 26, 1990, just 9 months from now. I will be carrying SAREX-2 on that flight consisting of the same Motorola HT that has been used in the past but this time with the inclusion of a packet radio TNC with some interesting features. We will of course be engaging in normal FM voice operation and packet QSO's with stations on the ground. But we have some other interesting modes which have been included in the TNC code. A meta-beacon which will allow loading text messages of up to 1800 characters will be available. This will allow the crew to compose mission status or SAREX scheduling messages for repeated downlink. A robot mode will also be available so that ground stations may connect with and receive a reply from the SAREX even when the crew is not available to engage in realtime QSO's.

Although our preparations for the Astro-1 mission are now in full swing and I don't always have time to post messages to INFO-HAMS I will try and keep the net posted on the project as things progress. Also stay tuned to QST and the various other Ham pubs for frequency and scheduling info.

73's
Ron Parise, WA4SIR
Astro-1 crew

1796. What is a VT-127A tube?

Newsgroup: rec.ham-radio
Date: 1989-07-28 14:33:09 UTC
From: uusgta@sw1e.UUCP
Message-ID: <1811@sw1e.UUCP>
Source record: 17770
Cross-posted to: sci.electronics,rec.ham-radio,rec.ham-radio.swap

I'm a radio collector and just aquired several boxes of old tubes, mainly early receiver tubes. One tube among them is unknown to me & I appeal to the net for answers or pointers to references.

Is anyone familiar with a VT-127A tube? An odd looking fellow, I assume it to be a transmitting tube with four separate lead-outs on the side & two on the bottom.

```
_
-=| |=-
-=| |=-
( )
| |
^
```

EIMAC is the manufacturer, and I find no mention of them in "Saga of the Vacuum Tube", "70 years of Tubes and Valves" or the tube itself in the RCA tube manual.

I'm interested in specifications, dates of manufacture & original applications. As an aside, I posted a request earlier for radio manuals, books etc. and got a mixed response. I'm still looking for Radio Stuff if anyone is looking to get rid of same.

1797. RF-feedback Problem

Newsgroup: rec.ham-radio
Date: 1989-07-28 15:35:11 UTC
From: franz%jrs@ics.uci.edu
Message-ID: <2153%jrs@ics.uci.edu>
Source record: 17771

My Yaesu 757GX tranceiver seems to be very sensitive to RF-feedback, the symptoms being severe audio distortion on SSB transmission and interference with the built-in keyer during CW transmission.

1) The problem occurs only on 21 MHz and above.

2) With a dummy load, the problem does not occur on any frequency.

3) The problem occurs both with a whip antennna in mobile operation and with a long-wire antenna and antenna tuner in fixed operation. I have not been able to try other kinds of antennas.

4) The severity of the problem is very sensitive to the length and positioning of the antenna feed line.

Has anyone else had a similar problem? Can anyone direct me to any articles about RF-feedback problems.

Franz Delahan (WC6Z)

>

It is indeed an entry-level (proposed) license; just like the Novice you
can't upgrade into it from a lower class license.

Many of these people will want to upgrade once they get some
experience and exposure to other amateur activities. Others will
use it only as a stepping stone to a higher class license; never
intending to remain at entry-level. Probably very few will decide to
remain at this level (ham wives, etc.). Still others will get the license
and decide Amateur Radio is not for them.

How we treat these newly-licensed people will determine how many
decide to stay. If we treat them as second-class citizens
rather than full-fledged amateurs, most of them will leave. If we
include them in our activities and show them that we are interested in
them, most will want to move ahead.

We should be concerned at the number of Novice licenses that are not
renewed or upgraded. If we assume that the proposed license will be
any different, it will backfire. We must remember that it will only be
a PART of a much broader effort to recruit new hams, and once they are
hams, encourage them to grow.

I agree entirely. If you use any of the servers available, consider donating to the cause. Even if you don't want the data yourself. $600 isn't much considering there are 480000 hams in the US (a tenth of a cent each 8-).

I've got a list of enhancements I want to make to the marvin callsign server including better searching commands and a mail based server so you guys without Internet access can get in on it too. But I have no interest in adding these hacks if the database is going to be out of date and useless.

Airfone, Inc. is using amplitude modulated transmissions
in the 899-901 MHz range for telephone conversations
between airline passengers and ground stations.

Flights over Chicagoland use the system, though the system
is nationwide. Airfone is operating under several FCC
licenses, but KK2XFO is the license that covers the
entire United States.

From: c0010@savax.UUCP
Message-ID: <1053@savax.UUCP>
Source record: 17776

All this code/nocode licensing, expanding the ranks, making use of now quiet frequencies...please consider the following.

1. What will people do with a no-code license? Talk to Hams? I doubt it. With the exception of a few individuals who seem to be hanging around hams I have not heard much from the technical people I know personally or work with, about any radio desires. About all I have heard is talk of email from people who currently use telephone modems.

Most of these people would not be served by a no-code license because they could not allow their telephone users messages to go out on ham bands without review. The other thought I have heard (from those around hams) would be nice to get at a repeater to talk to home or to someone outside local dialing range (almost the same reason the BBS people could want radio).

2. I wonder how many of you considered that a no-code license could be a NON-HAM license. The canadian license I believe is digital, is it an amateur radio license? Somehow I wonder if the public wouldn't be served better by allowing BBS people to do their thing, unrestricted by the "good language" rules. Although the perception is that hams are not building so much these days, I think our components have become radio's, computers, modems, tnc's, whole boards etc. Just as our fathers integrated tubes(but did not make them) we integrate larger and larger components, the radio is one of them! (I understand I am heavily computer related here, but ask yourself what are these possible no coders going to want to do with radios, probably connect computers). Why not let these people on the air, or maybe allow us to provide communications FOR these people without the normal restrictions on content...kind of a public communications band where amateurs provide the expertise.

3. I also understand that the ARRL is going over the amateur rules in conjunction with this no-code proposal stuff. Maybe it is time to look carefully at what service to the public means. How about some original thoughts about amateur radio's structure and class system (or the simplification of it (HF and the rest)). There isn't a great deal of difficulty to operating a vhf radio, maybe all this could be a communicators license. Does it matter that 2m is crowded when you talk about how others might gain access to radio? (The put them up there attitude). How about something in our licensing that says, "you can do what you have demonstrated you are capable of doing -- safely, correctly (not interfearence causing...)" How about a justificaiton for making an endorsement requirement...my radio works just as well in the extra band as in the general, in fact our charters are the same (as opposed

to talking in the police band that has a different charter). If digital techniques, satilite techniques, code techniques, TV techniques require specific knowledge to operate safely and correctly then test for that, I think thats what the FAA does for the most part. If it is too much paper work to administer all that stuff and the prevailing thought is you will learn from the others then open it up and let people learn. Right now classes seem more like status symbols, especially considering the way testing takes place. (I hear people who admit they only memorized the questions).

Please someone !!! Review the needs, requirements of the public (emergency or otherwise) and the current amateur radio hobbiests and do what makes sense backed by justification. This is the US we have the right to change the system for the better!!

I have a TS-130S and recently did an alignment. While I was in there
decided to enable the new bands (I haven't used them even though
they were on the rig disabled since 1981). I believe the instructions are in the
owners manual -- I might have seen it
it in the service manual though. It amounted to just pulling one wire out
from its connection (don't forget to tape it to avoid shorts.)

1806. ARRL no-code proposal

Newsgroup: rec.ham-radio
Date: 1989-07-28 20:23:27 UTC
From: albers@ka3ovk.uucp
Message-ID: <1989Jul28.202327.22453@ka3ovk.uucp>
Source record: 17780

(Have sympathy on my poor spelling -- it's late on Friday, and I have a hamfest to get ready for this weekend.....)

Well, in some of the postings about the no-code proposal, I have seen concern about not allowing access to 2m and down. I really think this was done to provide incentive to upgrade. If the 'no-code' licensee sees his friends having a good time down on 2 or 6, I think that would be a big incentive. When I got my Tech, I was not really confident enough to go for the 13, and for a time, I was content with what I had (This was before novice enhancement), and I had even been enjoying 2m SSB/CW. But my friends, who had a great influence on me, as most friends do, were in to DXing and contesting, so I finally was talked into upgrading, and I am glad I did, as I went to Advanced in one bound.

I guess my real point is (and I have said it before) we need to get more 'warm bodies' into the hobby. Those who come in under a no-code licence will have a chance to taste what amateur radio is all about, and will want to upgrade and continue to participate. If they have no interest, they will eventually drop out of the hobby -- who wants to put effort into something that is of no interest to them. The only 'static' (I won't say stagnent here) people no-code might bring in are the family members (kids, parents, etc) who use it for a matter of convienience. But I cannot tell enough times about the people who I have introduced to the hobby, only to be turned off by the code. I have never had anyone be discuraged by the written test, but the code test seems just to be too much for today's fast-paced life -- they may not be so sure if they will really have the time or resources to devote to the hobby, though the interest is there. If we can get them in to the hobby, they will find out for themselves wheather they like it or not, and if they do, the code is worth learning..

1807. Proposal: An Alternative Licensing Method (RE: NO-CODE) ** REPOST **

Newsgroup: rec.ham-radio
Date: 1989-07-28 23:23:17 UTC
From: pfluegerm@gtephxgtephx.UUCP
Message-ID: <44b2c64b.15840@gtephx.UUCP>
Source record: 17781

The following is a reposting of my recent message which I inadvertantly posted exceeding 80 columns. I apologize to those who had problems with this. There is also a brief addendum at the end.

Why all the fuss over no-code? How about maybe-code: you only get tested on it if you want the corresponding privileges. In fact, why not expand that idea to the whole licensing and privilege structure. It may even help bring in a lot of new hams while keeping the "quality level" high.

That's my idea/proposal: why not just grant a basic ham license on rules, regs, and some basic theory, then have "endorsements" for certain other modes of operation? Privileges would be tied (to some degree) to frequency allocation for that endorsement. The basic license would allow for limited capabilities of ALL modes/specialties. This would be similar to getting a pilots license (i.e. you can fly single-engine VFR in the daytime, but need endorsements for IFR, multi-engine, etc.).

BASIC LICENSE:

Demonstrate knowledge of rules & regs, frequency allocations, some basic applied radio and electronic theory, procedures. Gets you say 50-80% of all voice privileges (bands/frequencies) on HF and VHF/UHF. Allows very restricted but *REPrepresentative* use of other "special" modes (CW, digital, microwave, satellite/space, etc.) to get a "flavor" of and experience with the other capabilities. The basic license theory would *touch on* theory and procedures for these other modes. MUST know how a repeater works (my pet peeve) :) This should be roughly equivalent to today's General theory in difficulty and scope, but modernized and maybe more representative of actual knowledge, not memorization skills.

ENDORSEMENTS (examples):

Each endorsement permits additional privileges, including frequencies, for hams who have demonstrated detailed knowledge of rules, regs, PROCEDURES, and knowledge of APPLIED, modern theory in these areas. You can get any mix of endorsements you desire (or none!). Each could have one or more levels of proficiency with a corresponding increase in related privileges.

- CW: Demonstrate capability to send and receive morse - we'll stick with the current 3 levels, 5, 13, & 20wpm, each level giving additional frequency allocations. Basic license would allow CW experimentation, even though working knowledge of CW is not required (only theory of how it works).

- Digital: Demonstrate knowledge of computers and digital modes (RTTY, packet, etc.). Have at least 2 levels, one for slow speed (RTTY, packet, etc.) one for high speed (future digital audio, digital video).

- Microwave: demonstrate knowledge of microwave theory for privileges in these bands.

- Satellite/space: demonstrate knowledge of VHF/UHF theory and satellite/space (e.g. EME) procedures for privileges in these bands.

- Repeater/Remote Base: This endorsement is required before allowing a ham to put a repeater or remote base on the air. Also required is the applicable "Specialist" licenses for the band and mode where the repeater will be operated (e.g. a 2M packet repeater requires both the VHF/UHF specialist and Digital endorsements).

- VHF/UHF Specialist: Demonstrate knowledge of VHF/UHF theory, repeaters, procedures, etc. Gives additional frequency/band/mode privileges.

- Video: SSTV & FSTV privileges.

- Voice Specialist: Demonstrate additional knowledge of radio/electronic theory and procedures to get additional voice privileges HF/VHF/UHF, some microwave.

- Experimenter: demonstrate excellent knowledge of current electronic theory and applications. Allows experimentation with *ANY* new modes on restricted bands and frequencies (e.g. spread spectrum, channel hopping, digital audio/video)

- Pizza: this endorsement allows you to order pizza on the autopatch. (Just kidding on this one :)

CURRENT HAMS: current hams would be "grandfathered" so as to roughly keep similar privileges to what we have today. Every ham would be "upgraded" to the Basic License", and would receive the endorsements to get back to roughly their current level of privileges (e.g. current "General" class would get 13 wpm CW endorsement, and the lowest level of all other endorsements).

I'm sure there are other endorsements, other requirements. It needs to be fleshed out (I just thought of the concept and jotted down some ideas). So please, no flames on the details, only the concept :)

I think this idea has a lot of merit and would like to see some constructive discussion about it on the net (or anywhere else). Maybe this is a better way to go, maybe it isn't. I'd like to generate some ideas and move things in a CONSTRUCTIVE direction, not just have a code vs. no-code fight.

I *do* think that this might help bring in a lot of new hams. It sort of advertises what all you can do on ham radio, and you only have to know/learn/be-tested-on those points which are really applicable.

Addendum:

Thanks to everyone who has commented so far. Comments are generally positive - no one has rejected the *concept* so far.

Response to some of Phil Howard's concerns:
I realize this is a major conceptual change and would take time to put in place. You're right - no-code is needed (coming) sooner; one step at a time is OK, AS LONG AS WE KEEP TAKING THOSE STEPS (in a forward direction).

Certainly the FCC must be directly involved in the basic license, but maybe the rest could be handled through the ARRL, with tests being administered under the same VEC system we have today. Maybe the ARRL could even track and report endorsement changes to the FCC to minimize impact.

Just what endorsements there should be seems to me to be easily decided - one for each unique mode/capability (CW, packet, video...) and propagation (band) type (e.g. HF, VHF/UHF, microwave).

In article <8907250133.AA05007@ee.su.oz.AU>, arie@ee.su.oz.AU (Arie (Marwans assistant)) writes:
>
> There are alot of messages regarding radar detectors being falsely
> triggered. I am wondering about the alternative, is it possible to cause
> the radar detector not to trigger when a car is speeding?

First some terminology: Radar Detectors are what people put in their car, and radar is what police put in theirs. Do you mean that you want a device that prevents peoples radar detectors from going off? The answer is yes, use a frequency that detectors ignore. Otherwise no. If you mean a device to keep the police radar from getting your actual speed? Then that's possible too. Can you afford it? No. The new K Band devices only need about a 1 second burst to get your speed, so short range jamming is what your talking about. Very expensive, and not very practical. Detectors, and eyeballs outperform these jamming devices. For the older radars that transmit all the time, you have a possible chance to jam the radar. It's much cheaper to 1) Slow down when the detector goes off, and 2) Slow down when you see the police cruiser. (Your visual range is greater than their radar range). Most intelligent radar operators have developed some great tactics that should keep you on your toes! Some are: Operating at a curve with the radar antenna pointing at a tangent to the oncoming traffic. Sitting in a dip (or bottom of hill) and using the burst mode. The burst mode is so good that only your eyes will save you. This mode is sometimes called the "Pulse" mode. The only thing "Pulse" about it, is the finger pulsing the trigger. Not to be confused with "Pulse Radar". The last time I had this technique used against me was when the police car saw me closing on him (he was at the speed limit). He then pulled off, did a U-Turn and zapped me for 1 second at K band. He was visably pissed that I got away. In this case the radar detector was worthless, but my eyes saved the day.

> The obvious method would be to retransmit a signal in the K and X band
> regions at a slightly lower frequency...

Or slightly higher. What you propose is quite difficult actually: receive a signal, subtract your jamming speed from actual speed, and then retransmit a Carrier at the new frequency. Most "Hobby" jammers modulate the power supply DC at a frequency equal to the doppler shift jamming speed. These 100 mw devices may work inside 500 feet, but I wouldn't count on it.

I wouldn't use this method without about 10 watts, or a highly directional antenna with maybe 1 watt. Your in the kilo-Buck money range with this.

> But say I had a very good reflector mounted on the back of my car
> and that this reflector was constantly rotating in a way that waves would
> be reflected back at a lower frequency would this be legal?

In theory this should be possible. A technique used in an article I've seen in 73 Magazine many years ago, was to have a X band antenna and waveguide with a pin diode switched at the modulating frequency to short or load the tuned cavity. The writer: John Franke WA4WDL, said "The net effect is an amplitude modulated reflected wave that is capable of deceiving the police radar at ranges of only 20 yards" Big deal! I suppose you could also then rotate a tuned cavity and produce some effect. This may be an interesting area of study. The passive jammer by WA4WDL seemed to be almost as capable as the active jammer!

In most cases amplitude modulation sucks bigtime in the jamming business. If you find a jammer that says it uses amplitude modulation, pass it up. All other modes however are highly detectable using the audio output of the radar. Thus they too may highlight your car for another reason. The cop may have a field-day with you and your (impounded) vehicle, not to mention the FCC.

** DATASPACE '89 **

* AMSAT-EU ? *

At the second International Amateur Radio Satellite Assembly held at UoS on July 27 the formation of AMSAT-Europe was discussed. Delegates representing many countries discussed proposals for such an organisation but agreed that international co-ordination should be left in the hands of the IARU which already supports the necessary infrastructure.

The meeting urged smaller satellite interest groups to join one of the larger AMSAT groups to obtain regular updates on the Amateur Radio Satellite programme for local dissemination, rather than create a costly new organisation.

Dr Martin Sweeting, G3YJO, said that it was important for satellite constructors to meet annually to exchange ideas, and the currently informal arrangements at international meetings are working well.

* BAND PLANNING IMPORTANT *

Cees van Dijk, PA0QC, Chairman of the IARU Region I VHF/UHF Working Committee told the meeting of the importance of frequency bandplanning. He said that Administrations expect Amateur Radio Organisations to manage their own allocations in a responsible manner. This work has to be done by international co-operation and consultation. He was critical of the inclusion of satellite uplink frequencies in the region 144.300 - 144.500 MHz for mode JL on OSCAR-13. This was not in the bandplan and has created problems.

* RS-S SATELLITES *

Dr Geswindt, HA5WH, reviewed plans for co-operation between the USSR and East European countries for a series of satellites to be designated RSS. The first one will most likely be launched during 1991 and will include mode A and J. Three to four launch opportunities will be available during the next five years.

* EDUCATIONAL / SCIENTIFIC SATELLITES *

"An important infrastructure for future Amateur Satellites"

Dr Martin Sweeting, G3YJO, told the delegates that the construction of Educational and Scientific Satellites combined with Amateur Radio activities could provide the necessary infrastructure and finance needed for a sound Amateur Satellite development programme. By using Amateur Satellites to prove new technological concepts which later may find use in a commercial application would benefit the hobby and create a pool of expertise.

Hans vd Groenendaal, ZS6AKV, stressed the need for the creation of interest in electronics amongst young people at schools. "Project Ski-trek on OSCAR-11 is a perfect example" he said.

Rich Ensign, N8IWJ, added that with DOVE's launch still several months away, the project had already created much activity in schools.

I do plan to present a petition/proposal to the FCC offering a different idea. I encourage others to do so as well. I am sure the FCC is not going to increase the likelyhood of turning down all codeless license proposals just because there are different ones suggested.

If the FCC issues a NPRM for a codeless license just as the ARRL proposes, I will then file comments supporting the NPRM, and will also suggest that some changes be made (1: lower power (50W), 2: 6 and 2 meters access) with arguments why these should be the case.

My proposal includes a FULL Technician class that is also codeless (and without HF privs), but if the FCC goes with the ARRL idea, I will leave that aspect alone for the time being, and bring up the issue "why learn code for higher ATV power, repeater control, etc?" at a later date as a separate proceeding.

That's what it says. That's what the league decided to do. I'm anxious to read the minutes of the meeting and see if/what they discussed on the matter.

The general reasoning is that by not including 2 meters, we will not be pressing the otherwise already overcrowded 2 meter band with more hams. Those who actually DO FEAR and further overcrowding, and might say NO to a codeless license class, certainly must believe that lots of hams who otherwise would not be hams, will with this license class. Those who are not including 2 meters are wanting the other group to say YES, instead.

The above overcrowding probably applies only to the big cities of New York, Chicago, Los Angeles, etc. Out here in the boonies of Urbana-Champaign Illinois, there is nothing BUT 2 meters. The new Communicator class license operators will only be on 220 Mhz and up. If this proposal goes through as is, I am sure there will be a new 440 Mhz repeater in town, but the sad thing is that it will be populated mostly by all the new hams, who will not benefit from the practice and constructive criticisms of other hams, and will develop bad operating practices. This is the Ghetto Culture effect.

The proposal I put on the HAMLICEN mailing list has the following structure:

Novice - unchanged
Basic - 50-2450 Mhz 50 W, 3300-up Mhz 5 W, no repeater/beacon/aux
Technician - same as now only above 50 Mhz

Novice+Basic - combined privileges
Novice+Technician - combined privileges

General, Advanced, Extra - unchanged

Fundamental differences:
- CW not required to be repeater owner, just MORE THEORY/REGS/etc
- CW not required for full power, just MORE THEORY/REGS/etc
- 50 W instead of 250 W for the new class
- Licenses with TWO CLASSES
- 6 meter and 2 meter privileges for the new class

You are eligible for a USA Amateur Radio license unless you are an agent of
any foreign government. If you are, you would not be here on an F-1 anyway.

> 2) I suppose I have to go through the examination process again. In India, we
> had a rule which stated that a person majoring in Electrical engineering is
> exepmt from the theory test requirement. I wonder if similar rules exist here.
> Also, what is the structure of the examination?

Yes you have to go through the examination process. The bureaucracy is not
as bad here as it has been said to be in India. The FCC typically gets the
licenses out 5 to 7 weeks after the exams are passed. Some of that delay is
probably VEC processing before it gets to the FCC.

> 3) I assume knowledge of morse code is a primary requirement for the issue
> of license and that is something I need to practice. Which are the stores (or
> mail order companies) that usually deal with morse practice equipment ?
> (the morse key, oscillator, head phones, audio morse code practice cassettes
> etc.) Any brand names \ companies recommended?

Yes, Morse Code is still a requirement for all license classes. Just about
every mail order outfit has the books, tapes, and equipment you need for
practice.

1814. Re: ARRL no-code proposal

Newsgroup: rec.ham-radio
Date: 1989-07-29 07:30:56 UTC
From: kminor@ms.uky.edu
Message-ID: <12306@s.ms.uky.edu>
Source record: 17788

I have seen, as others have, complaints about the ARRL no-code license proposal, because it does not allow access to the 2 meter band. I agree with this, but not because I want the "no-coders" to be stuck on bands that aren't used by amateurs. I like it because it will help populate some bands that need it badly. Also, I get the impression that some people think a no-code license will give them full priveleges on the amateur band. The fact is, it won't. Don't forget, if you pass a no-code test, you're at the entry level. If you want more bands/priveleges, (and you're getting more than you think) then you need to study for the higher class of license.

Let me state here that I am against no-code, at least what is being proposed now, but that's beside the point. I could support a no-code license if more was added to the theory. If the proposal is accepted, and passed, however, I will seriously consider buying a 220 mhz rig or 440 to specifically talk to the new hams.

A final thought, which is what really concerns me the most. There are some hams that feel that a no-code license will make the ham bands into a new CB band. With the attitude of many hams, this is precisely what will happen, but not for the reasons they may think. What I could see happening is that 220 and above would be basically left for the no-coders, who need our help MOST when they first get their license. Think about it. I remember when I was a novice, I was greatful for the extra class operators who took the time and worked with me on the air to teach me good operating skills. If we get a lot of new hams out of this new license, if it passes, they're going to need our help to learn what they can and cannot do, and I'm not talking about regulations here. I didn't understand what over-deviating a 2 meter rig meant until I was on the air and heard it. If no-code does turn out to be a new form of CB, then amateurs, I feel, would be part of the blame, because they would not take the time to teach new hams what to do.

These opinions are mine and not meant to insult anyone, just to make you think.
73,
Kevin

1815. General coverage mod for YAESU FT-747GX

Newsgroup: rec.ham-radio
Date: 1989-07-29 13:55:06 UTC
From: Pete_Simpson@DGC.MCEO.DG.COM
Message-ID: <8907291455.AA00042@adam.DG.COM>
Source record: 17784

```
CEO file contents:
--------------------------------------------------------------------------------
General Coverage Mod for YAESU FT-747GX
--------------------------------------------------------------------------------

1) Remove top cover.

2) On backside of display unit, there is a brown jumper
wire near the large ribbon cable.

3) Cut the brown jumper wire.

4) Turn the radio on and set the frequency to 12,345.6 KHz,
then turn the radio off, then on again.

5) This enables the general coverage mode and a GEN display
will come on and stay on at the top of the LCD display.

6) Reassemble the unit. It will now transmit everywhere it
receives, however, Yaesu recommmends that it only transmit
between 1.8 - 30 MHz.

Disclaimer: I'm passing this on from someone who owns one of these and
has done the mod. I have not done or tested this mod. You do it
at your own risk.
```

1817. LASER Radar Detectors?

Newsgroup: rec.ham-radio
Date: 1989-07-29 18:09:23 UTC
From: 17158EJG@MSU.BITNET
Message-ID: <13517158EJG@MSU>
Source record: 17785

Here in Michigan, they are really starting to get serious about speeders. Personally, I think that's terrible, but I don't think there's much I can do.

For one thing, the MI State Police now own a number of unmarked Mustang LX cars, with some special options which aren't available to the "normal customer" according to one report I saw on TV. That alone is somewhat of a deterrent. But even worse, they are also equipped with a new LASER-based speed detection system which is supposed to be _impossible_ to detect due to the extremely-fine beam it puts out, not to mention it is light and not a radio wave.

So how do you "jam" or whatever you wanna call it one of these things? My friends and I thought it would be neat to paint our cars with that RADAR-absorbing paint they have, but now it would be useless. (And probably look bad, too.)

I like the idea of getting a set of "night vision" glasses and running without any lights in a very dark, non-reflective car... ;-)

P.S. I'm still looking for repeater ID's!! The more the better!

SpaceNews

MONDAY JULY 31, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly
around the world. It is available for UNLIMITED distribution.

* STS-28 LAUNCH ADVISORY *

LAUNCH DATE SET FOR STS-28

NASA officials meeting at a Flight Readiness Review at the Kennedy
Space Center, Florida, on July 26th set August 8, 1989, as the
launch date for STS-28. The launch period for the Department of
Defense-dedicated Space Shuttle mission will be from 7:30 to 11:30 AM
Eastern time. This schedule depends upon completion of work in progress
and cooperative weather allowing normal pad activities to continue.

Launch countdown preparations for Columbia and STS-28 will begin this week.

* OSCAR-9 NEWS *

The current operating schedule for OSCAR-9 indicates that Diary software
reloads will take place on Tuesdays, UTC. Digitalker telemetry will follow.
The telemetry channels currently being downlinked by the Digitalker include:

08 : Battery Pack A Temperature (C)
18 : Battery Pack B Temperature (C)
22 : Battery Voltage +14V (Volts)
29 : Spacecraft -Y Facet Temperature (C)
35 : 145 MHz Beacon Output Power (UnCalibrateD)
39 : Spacecraft +Y Facet Temperature (C)
49 : Spacecraft +Z Facet Temperature (C)
59 : Spacecraft -Z Facet Temperature (C)

Note that the telemetry value for channel 35 is UnCalibrateD (UCD).
In order to decode the proper value for this channel, substitute the "N" value
given by the spacecraft into the equation : (N-82) * 1.67. The result is given
in milliwatts.

* DATASPACE '89 *

The second International Amateur Radio Satellite Assembly was held last

week on July 27th at the University of Surrey in England. At the meeting, Dr. Geswindt, HA5WH, reviewed plans for co-operation between the USSR and East European countries for a series of satellites to be designated RSS. The first one will most likely be launched during 1991 and will include modes A and J. Three to four launch opportunities will be available during the next five years for these new satellites.

Dr. Martin Sweeting, G3YJO, told the delegates that the construction of Educational and Scientific Satellites combined with Amateur Radio activities could provide the necessary infrastructure and finance needed for a sound Amateur Satellite development program. By using Amateur Satellites to prove new technological concepts which later may find use in a commercial application would benefit the service and create a pool of expertise.

Cees van Dijk, PA0QC, Chairman of the IARU Region I VHF/UHF Working Committee told the meeting of the importance of frequency bandplanning. He said that Administrations expect Amateur Radio Organizations to manage their own allocations in a responsible manner. This work has to be done by international cooperation and consultation. He was critical of the inclusion of satellite uplink frequencies in the region 144.300 - 144.500 MHz for mode JL on OSCAR-13. This was not in the bandplan and has created problems.

1819. Cable cable.

Newsgroup: rec.ham-radio
Date: 1989-07-29 21:11:30 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <157628@Wayne-MTS>
Source record: 17804

I have, courtesy of a friend in the CCTV biz, abouyt 1000' of good, unused RG-6 cable. Interesting stuff; double shielded, and with a (I assume) silicone grease inside the jacket, for waterproofing. All in all, good stuff.

I just ran a length of it to a vertical in the back yard, using a combination of F-56 connectors and F-to-UHF adapters. This works well enough, but I wonder if anyone has found a better way to terminate this stuff? Is there, for example, a connector other than F for this stuff?

I've been reading a few articles about this stuff, and everyone seems to agree that it's pretty useful- especially given that dipoles are 72 ohms (ideally). One thing I haven't seen mentioned is that a lot of it- the stuff designed to be strung on poles- has a "messanger" wire attached. This is a strain relief that enables it to be pulled taught w/o straining the crimp-on F connectors. Nice system. And if you don't need the messanger, it zips right off.

A related wire question: Has anyone use shielded twin-conductor wire for transmission line?

Mike KE8YY

1820. Radar Detectors

Newsgroup: rec.ham-radio

In article <8907250133.AA05007@ee.su.oz.AU>, arie@ee.su.oz.AU (Arie (Marwans assistant)) writes:

attctc!sampson@ames.arc.nasa.gov (Steve Sampson) replies:

>> The obvious method would be to retransmit a signal in the K and X band
>> regions at a slightly lower frequency...

>Or slightly higher. What you propose is quite difficult actually: receive a
>signal, subtract your jamming speed from actual speed, and then retransmit
>a Carrier at the new frequency. Most "Hobby" jammers modulate the power
>supply DC at a frequency equal to the doppler shift jamming speed. These
>100 mw devices may work inside 500 feet, but I wouldn't count on it.

Steve I agree that what he proposed would be very difficult (read expensive).
However I disagree with your statement on "hobby" jammers. The method
you quoted works very well and a whole lot further than 500 feet.

>I wouldn't use this method without about 10 watts, or a highly directional
>antenna with maybe 1 watt. Your in the kilo-Buck money range with this.

Well first off don't forget about the gain from the feedhorn, the ERP is
not going to be 1 milliwatt. And while 10 watts from a magnetron would be
real nice... you're right.... very expensive.

Let's talk about the method of varying the DC power supply to the Gunn Diode
that is being used as the transmitter. Since varying the supply voltage
causes a change in frequency, the effect is that of a "swept spot". The
uses of swept spot are not just limited to those of AGC pumping and track
breaking as is normally the case since we are dealing with a doppler system
here. Sweeping the spot at the doppler shift rate causes a meandering effect
to the receiver and on some models will also cause it to appear as multi-
path and will hence be ignored. We don't need to 'capture' the AGC and we
don't need massive power.

Remember that the POLICE RADAR is using very low power too, and anytime your
jammer uses close to the same power as the RADAR you are trying to jam, you
are off and running big time! Check out what the police radars are using!
In all but the VERY old ones, Gunn Diodes are IT! So your range estimates
are pretty far off the mark... and in fact, the greatest danger WILL be in
close as the police RADAR could (and will) effect jammer burn-through.

The biggest problem is that some of the "pulsed" police radars are not
T/R'ing the receiver. If the cop is driving down the road without
transmitting, along comes your jammer and he pops up with a speed
reading! VERY suspicious! So now the problem is to develop JAMMER LOOK
THROUGH. You have to detect the radar, turn on your jammer, and then

turn the jammer off at intervals and "look" to see if the radar is
still on! Now we need to have a very good receiver and some associated
timers to go with it, not to mention fast T/R times.

More problems: Since due to ERP requirements you are stuck with directional
antenna, you are going to need forward and aft protection on both X and K
bands. That's 4 Gunn's, and 4 feedhorns PLUS the receiver! As you said, the
price starts becoming prohibitive.

However my whole point in writing this was to bring out that swept spot
Gunns at 10.525 GHz are VERY effective. Their jamming range is WELL in
excess of the RADARS normal speed detection range.

Passive avoidance (with a good detector/receiver and pushing on the break
pedal) is without a doubt the best way to go if you are trying to avoid a
ticket. Blasting through a radar trap at 90 mph while the cop reads 55 mph
is a little ridiculous since the guy DOES have eyes! :-)

However if you are willing to break the law, risk your ham ticket, etc.,
etc., you can create some interesting havoc with a Gunn swept spot emitter
by making a police radar read 110 mph on a MOPED doing 15 mph! :-)
The look on their face would be rather priceless don't you think?

If this sounds like I have done some experimenting in this area....
I would never admit it.

>> But say I had a very good reflector mounted on the back of my car
>> and that this reflector was constantly rotating in a way that waves would
>> be reflected back at a lower frequency would this be legal?

>In theory this should be possible. A technique used in an article I've seen
>in 73 Magazine many years ago, was to have a X band antenna and waveguide with
>a pin diode switched at the modulating frequency to short or load the tuned
>cavity. The writer: John Franke WA4WDL, said "The net effect is an amplitude
>modulated reflected wave that is capable of deceiving the police radar at
>ranges of only 20 yards" Big deal! I suppose you could also then rotate a
>tuned cavity and produce some effect. This may be an interesting area of
>study. The passive jammer by WA4WDL seemed to be almost as capable as the
>active jammer!

This really does sound interesting. I have heard a little about it but have
never tried it. Any experienced people out there care to elaborate?

1822. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1989-07-29 22:57:04 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8907300704.AA03527@ucbvax.Berkeley.EDU>
Source record: 17803

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

1823. I need a Flitephone III manual

Newsgroup: rec.ham-radio
Date: 1989-07-29 23:55:41 UTC
From: jay@splut.conmicro.com
Message-ID: <2795@splut.conmicro.com>
Source record: 17793
Cross-posted to: rec.aviation,rec.ham-radio

I picked up a Wulfsberg RT-18 Flitephone III at a hamfest today. It looks complete, but I have little documentation. I wanna move the thing to the 440 MHz amateur repeater band, and would prefer not to have to reverse-engineer it...

I'm looking for documentation on the radio. Schematics, at least; more, if available. Any of you avionics types out there (or anyone else, for that matter) that can help, please drop me email; I'll gladly pay for copying costs.

Thanks in advance for the help...

1824. Sony ICF-2010 mods?

Newsgroup: rec.ham-radio
Date: 1989-07-30 03:17:28 UTC
From: cruff@ncar.ucar.edu
Message-ID: <3822@ncar.ucar.edu>
Source record: 17792

Has anyone looked at or figured out how to modify the Sony ICF-2010
receiver to expand the coverage further into the VHF-low and VHF-high
bands? It seems like it might be possible, but I haven't seen the
schematic yet. Specifically, it would be nice to extend the coverage
from 30 to 50 MHz and from 136 to 170 MHz.

1825. HELP...SHORT DIPOLE NEEDED IN XX9 (MACAU)

Newsgroup: rec.ham-radio
Date: 1989-07-30 04:31:47 UTC
From: wheatley@cbnewsk.ATT.COM
Message-ID: <724@cbnewsk.ATT.COM>
Source record: 17805

I need a short dipole to install on the roof of an apartment building in Macau. I have seen the B&W antennas, etc. Anyone have any comments on shortened dipoles (other than the fact that they won't work as well as full length). How effective are these things, what brand/design have you used, etc.

Hope to work some of you from Macau in late august!

Source record: 17802

brian@ucsd.edu (Brian Kantor) writes:

>I don't want something that will JAM the police radar, I want something
>that will make it EXPLODE.

Brian, I have some stuff that will come close to meeting your objectives
but you'll have to figure out a way to do over 150 knots in your car to
power the big wind driven generator on the pod. :-)

Also at the power levels developed you'll probably do some damage to
the driver too.

Oh well, the sign as you came into Virginia said "Radar Detectors are
Illegal and will be Confiscated".... it didn't say anything about melting
the State Trooper!

Oh yeah... if you want the complete system, it'll cost you around
$70,000,000 and you'll need to get your private pilots rating... It's
called a Grumman EA-6B. Comes with instructions.

> ---
> * Via ProDoor 3.0R

According to FCC news releases, these phones use 894 to 896 MHz for the air-to-ground link and 849 to 851 MHz for the ground-to-air path. The handset that you take back to your seat is cordless, and I have no idea what frequency it is on.

I think they operate like a giant cellular system with some very large cells. As your flight proceeds across the country your call can be handed off to a new cell as you move into a new area.

I have never scanned from 849 to 851 MHz, but I bet you could hear some calls there. I don't know if you would be able to hear both sides or not.

I have used them on planes before. One came in very useful when I was flying from Southern California to home in Seattle on a short business trip. We were over Northern California when they decided to turn the plane back to San Francisco because of heavy fog in Seattle. The plans for hotel accomodations for the now stranded passengers was unknown. I grabbed for a phone, called my pal Doc in SF who had been bugging me to come visit anyway, and in less than a half hour he was meeting me at the airport and driving me back to his apartment for an overnight visit. It was well worth the $7.50.

Another thing I have discovered is that once you are back on the ground you can call 1-800-AIR-FONE and tell them that you didn't like the transmission quality, and they will credit your Visa card!

1828. ANARC BBS Number?

Newsgroup: rec.ham-radio
Date: 1989-07-30 05:44:20 UTC
From: tad@ssc.UUCP
Message-ID: <126@ssc.UUCP>
Source record: 17808

A month or two back I saw a posting giving a new phone number for the ANARC BBS. I think this is an SWL oriented BBS. The message said that the new number would be good around July 1, but all I get all month is a recording saying that the number is not in service.

I have the number as 913-355-1978. Did I copy it wrong?

THE BANDS THIS WEEK HAVE BEEN FROM FAIR TO POOR, WITH SOME DAYS VERY
ACTIVE, AND OTHERS VERY DEAD. THOUGH THERE HAS BEEN SOME ACTIVITY IN THE
DXPEDITION ARENA, AND ALSO SOME RARE STATIONS REPORTED (IF THEY WERE REAL).
SO MAYBE LIFE IS COMING BACK INTO THE BANDS.

OUR THANKS THIS WEEK GO TO G3XTL, G0ABI, G3GNR, OD5NG, TG9VT, W5KSI, VK6XQ
AND VK2EG. THANKS FOR THE INFORMATION, CHAPS. EVERY LITTLE BIT HELPS TO
MAKE THE DX NOTES INTERESTING.

Well, I'm a pilot and a ham. The reason this reg exists is that some
equipment does interfer with avionics and navigation equipment. Just
because some ham wants to talk on the repeater is no reason to endanger
the lives of the other people on the flight or on the ground. Some
equipment interfers... the risk greatly outweights the benifits.
Please, lets leave this one alone.

>things, what brand/design have you used, etc.

THe old saw is "if it conducts it radiates, the higher and bigger it is the better it will get out". It still applies, height being the most important of the two. For heights under about 240ft the DX signal strength is roughly doubled by doubling the height (its more than that for heights under 40ft!).

There are two effects of shortened or "mini" antennas, they have a very high Q (low radiation resistance not low losses), and are much less directional than a "full size" version.

IFF (if and ONLY if) the antenna is well built with ohmic losses close to the radiation resistance (i.e. around .01 ohm) then the radiated power efficiency will still be quite high.

So whats the botttom line? Try a "mini-quad" to get all the directionality you can, make sure the antenna is constructed of large diameter tubing with large contact areas (.01 ohm!), and put it up as high as you can get it.

Of course there is at 20db gain with the right location - such as Macau :-)

Oh yes, don't forget us CW nuts down at 14.005, 21.005 etc. - keyboard or keyer its still CW!

>(ideally).

Actual impdeance varies all over, but good low loss cable is always worth
the effort. Watch for matching to a solid state transmitter though, you
have a 1.5:1 SWR right off (at the transmitter end) and some xmtrs start to
shut down at 1.2:1!

>One thing I haven't seen mentioned is that a lot of it- the

>is a strain relief that enables it to be pulled taught w/o straining the
>crimp-on F connectors. Nice system. And if you don't need the messanger,
>it zips right off.

If you "hang" the wire from the dipole then its one of the nicest features!

>A related wire question: Has anyone use shielded twin-conductor wire for
>transmission line?

Yes, unless you need the shielding for some reason don't mess with it, its
a real kludge. You get the balancing hassles of twin lead with the loss of
coax. If you need or can tolerate a balanced feed (i.e. antenna tuner),
then open wire ladder line is a superb choice - tune anything anywhere
(almost!). THe biggest problem is that antenna tuners don't attenuate VHF
(TV) harmonics very well, and of course need adjusting.

psuvm!msu.bitnet!17158ejg@psuvax1.cs.psu.edu (Eddy J Gurney) writes:

>But even worse, they are also equipped with a new LASER-based
>speed detection system which is supposed to be _impossible_ to detect due to
>the extremely-fine beam it puts out, not to mention it is light and not a
>radio wave.

This is more than possible in theory as the military is already using
range and rate tracking systems using lasers. However if the local law
has this stuff it's a first to my knowledge. The dangers of this are
rather awesome to consider since you'd have low powered laser beams
flashing directly into a drivers eyes. One of the big worries for the
military pilot is exactly this! The bad guy (either land, ship or air
based) 'flashes' a high powered laser across the cockpit of an aircraft
thus either temporarily or permanently blinding the guy. It is hard to
develop goggles to filter this out since you can change the wavelength
of the laser which then of course defeats the goggles. Think about
trying to fly an aircraft with no eyes. Nasty stuff.

Obviously though that is not going to be the intent of the policeman,
however I would get VERY irate if I found out some jerk was pointing a
laser in MY eyes! To jam something like this is not as hard as you
might think.... you find out the laser wavelength and jam it in much
the same fashion as you would radar. The concepts are basically the
same. By the way, smoke generators are fairly effective against laser
tracking (the idea is to diffuse the beam) so all you have to do is
get one of those smoke generators from a WW-II PT boat and you have
a great system. Of course this only works if he's behind you, but then
all the cops will also be too busy handling all the wrecks you cause!
I like it!

>My friends and I thought it would be neat to paint our cars with that
>RADAR-absorbing paint they have, but now it would be useless. (And probably
>look bad, too.)

A Stealth Mustang huh? Good idea. Seriously though, there is no such thing
as RADAR absorbing paint. There is LOW infra-red signature paint for
reducing the effectiveness of IR tracking (not much choice in color
and it is pretty ugly), and there are honeycomb designs for diffusing
radar returns... but I've never found a radar absorbing paint.

I would be very interested if you could find out any details on this
possible police laser speed detection system. A manufacturer would be
enough. I suspect (hope) that somebody is pulling your leg, but then it
is possible.

> personally or work with, about any radio desires. About all I have
> heard is talk of email from people who currently use telephone modems.

I've talked to several people about becoming hams. A lot of these people are technical people, but another whole group of them are public service oriented people (from storm spotters to policemen). My contact is in part because I am promoting Amateur Radio. Still, a salesman can't sell a lousy product to a smart customer.

> Most of these people would not be served by a no-code license because

There are these people. Perhaps one of them will be listening to the repeater when you are calling from the freeway about a 10 car pileup.

> 2. I wonder how many of you considered that a no-code license could be
> a NON-HAM license. The canadian license I believe is digital, is it an

The FCC would never do it. They got burned bad with CB, which was an attempt to put radios in the hands of everyone. A NON-HAM service would not benefit from association with ham radio, and for THAT reason could easier degenerate into CB. This is why is it NECESSARY for ARRL's Communicator class to have access to 144.1-148 Mhz.

> Please someone !!! Review the needs, requirements of the
> public (emergency or otherwise) and the current amateur radio hobbiests
> and do what makes sense backed by justification. This is the US
> we have the right to change the system for the better!!

We also have the right to object to and try to block any changes we don't like, for whatever reason we want. Some people are just excercising their rights when they are against a codeless license class.

> entry level ticket.

It may well be the FIRST license a lot of people get, and many people will be just happy with it being the LAST license they get. I would not quite call it entry level for these people unless there is also ANOTHER CODEFREE license class. Yes, many "codefree" hams will get exposure to morse code, and learn it and upgrade to another class. Most probably never will, but there is nothing wrong with that, either. To each his own.

1838. No code? How about no SSTV?

Newsgroup: rec.ham-radio
Date: 1989-07-31 03:13:43 UTC
From: lcb@swituc.UUCP
Message-ID: <186@swituc.UUCP>
Source record: 17812

First I will admit I have not read all the postings on the
no-code issue. I can bet it is mostly the same as we have
read before. Here is a thought that crosses my mind and I
can't resist saying it...
Ever seem to you that the people who are really against code
are the ones who don't want to use it? I am always hearing
the argument "I don't ever use CW so why do I have to know it?"
etc.
Code may be hard to learn if your heart isn't in it..agree?

Well, I personally don't forsee ever using SSTV for example
so why did I have to study all that technical and regulatory
stuff? Why not only test on things we like and intend to use?

Sounds like the train of thought I keep hearing from the
no-code advocates. Amateur radio gives us priviledges and
responsibilities that I don't mind studying for... guess not
everyone wants to be a part of the whole.

I have been licensed for 10 years. I work CW only, because I
really enjoy it. I was a single mother with 3 kids (2 in diapers)
when I got my first ticket, which was an effort for someone who
had no idea what a "ham radio operator" was, let alone a diode.

Why all the fuss about passing a few tests? People from 8 to 80+
have done it so it can't be THAT bad.

Enough said.

Subject: Re: RF-feedback Problem

Your symptoms are the same ones I have encountered on several occasions with RF in the shack. The problem is probably that your connection to ground is not a low RF impediance at either the operating frequency or some harmonic. The result is the RF builds some reasonable voltage level on the rig case, and the "ground lead" is then really an antenna. I have used the MFJ artificial ground to help aleviate most of this type problem

Tell me the truth, folks, is it really worth all the trouble of even buying
a radar detector, installing it, "keeping your eyes open for cops", etc.?
Why don't you just go the speed limit? Going 10 mph faster is only going
to make a few minutes difference in your destination time anyway.
I usually go the speed limit, or maybe 5 mph faster, mainly because that is
what everyone else does, and I don't like to hold other people up.
The speed limit is there for your protection, so instead of trying to find
ways to allow you to get away with speeding, why don't you just relax and
leave a few minutes earlier and go the speed limit?

I used to speed all the time. Then I got married, had a kid, and now feel
more "responsible". So I just go the limit.

Subject: Re: Kenwood TS-440 Comments

HI! Sorry I could not get in on the original round of comments, but I just added rec groups to the system here ... I have had a 440 now for almost 2 years. I love it. Mine is on 24 hours a day. (No lie) I sleep to the gentle sounds of static or CW .

When I bought my 440, money was almost no object. It was the first piece of new gear I ever owned, and I looked at all the rigs, I kinda wanted a PARAGON, but they were still on the drawing board. I almost got the 940, but did not like the way they handled memory allocation. I am a SWL in addition to being an active ham, and the 100 memories were a REAL PLUS for me. I had them all filled in a few days, and scan all 100 just about every day (often several times).

The only thing I do not care for is the way they do the keypad entry, but if it was something that REALLY bugged me, there is an accessory keypad made by a 3rd party manufacturer... Fact is, I never use the keypad. ALL the frequencies I operate are in the memory channels.

The only problem I had with the set was that I got concerned once during a lightening storm, and I turned it off (for the first time in a year!). When I turned it back on, the VFO was unstable and warbely. It went from instability to a weird oscillation. I sent it to ARS for repair, and had it back two weeks later, repair bill was about $75, less than what I figured it would be. It has performed flawlessly since then and like I said, mine is never turned off (I have an antenna grounding switch now, but leave the radio on) I come from a broadcasting background, and learned that it is the surge of turning things off and on that kills them.

With the money I saved on the 440 over the 940, I was able to buy a HENRY 2K linear...

I always get compliments on the audio and "punch"

One fine rig, you made a good choice...

Actually, looking for a 40/80 meter antenna, on top of a lift shaft
on a fairly narrow apartment building. Looks like one of the
"shortened" dipoles may work. Better than nothing....the QTH has a
beam for 10-20 meters

> Oh yes, don't forget us CW nuts down at 14.005, 21.005 etc. - keyboard or

> over-reaction to a non problem.

FAR 91.19 was written after a fatal airline crash which was determined to be caused by the operation of an FM braodcast receiver by a passenger. The RF radiated by the local oscillator caused a false station passage signal in the cockpit while on a ADF instrument approach, and the crew therefor began a decent prematurly.

I've watched as aircraft navigation radios have shown wild deviations as 2M HTs were used. I sure wouldn't want this type of interference to show up in the middle of an instrument approach in heavy weather.

This is one regulation that I don't want to see changed! In the name of safety, I'll certainly give up the use of my radios for a few hours and avoid jepardizing the safety of myself and the other passengers in the flight. Just because you don't want to be deprived of playing with your toys for a little while is not enough reason to risk other people's safety.

1844. And the NO-CODE debate goes on!!

Newsgroup: rec.ham-radio
Date: 1989-07-31 14:00:03 UTC
From: 702WFG@SCRVMSYS.BITNET
Message-ID: <8908010726.AA19236@ucbvax.Berkeley.EDU>
Source record: 17816

Well, The Great NO-CODE Debate is still in full swing. I wonder what our non-ham readers think of what they see. My perception has been rather eye opening. I have found out not only how priveledged I am but also how these poor shmucks who don't have their ham license can't raise their level of existence without my help and of course we all know how un-fulfilled their lives have been up to now without a ham license.
And then everyone wonders why people call us ELITIST!!!

SO much for the soap box. Now I have some real information for those interested in a workable NO-CODE license that works.

So far the only ones generaly involved in this debate have been hams. The interesting thing about that is we won't be heavily impacted (except maybe by the number of new hams) by any of these proposals because we already have our licenses meaning we passed a CW test already. So the best way to reduce impact is to favor the worst plan so it doesn't work and we don't get a large influx. (Maybe that is what the ARRL had in mind :-)

But for those seriously interested in the NO-CODE wars ending with a workable new license system maybe you should look at who you are addressing. When it comes time to write responses to the FCC in answer to the ONE/MANY proposals, the people who should be writting in should include those without licenses who want to get into radio. Unfortunately, they don't usually read the ham rags or The Federal Register and are probably not even aware that there are any proposals being designed. Maybe the audience for this discusion needs to be expanded to include people like ANARC and the national SWL group (I don't know it's name) and maybe even distribution to the various BBS Networks like FIDO or OPUS. After all they stand to gain the most and therefore have a vested interest in what transpires.
Like some others on this group I also have contacts in my day to day business who can bring a lot of good into the hobby who are held back by the fact that they can't justify spending time learning something that offers them nothing.
I think it is time those of us who are in favor of a NO-CODE license took our attack to a different battle ground. There are a lot more non-hams than hams. If it comes down to votes the winner should seem obvious at this point. Maybe this is what it will take to get someone to put together a plan that is more than a GHETTO for all the great unwashed.

From: ajb@itivax.iti.org
Message-ID: <2479@itivax.iti.org>
Source record: 17680

A preivous poster suggested a moving reflector. I have
thought about this for a while now. Why not just mount
a few corner cube type retro-reflectors on a stick
and place it on top of the car? It would look like the
gages used to measure wind speed. As the car move, the
retro-reflector would start to spin, moving the
retro-reflector cubes at an apperent speed much lower then the
car. Since the signal off the cubes would be much greater
then the car's reflection, the radar would try to read
the cube speed. The cubes would be moving, so the
apparent speed would be modulated from the cars true speed
to the reflectors speed and back to the cars true
speed in a sineusoidal pattern with every sweep of the
retro reflector in the field of view. This might prevent the
radar detector from ever 'locking on', because the speed is always
changing. The only problem is that
from behind, the retro-reflector signal would give a reading
of speed greater than the car speed. This would be simple
to build, but would look funny on top of your car.

What do you think?

1847. Badger's balun

>
> [...] For heights under about 240ft the DX signal strength is roughly
> doubled by doubling the height (its more than that for heights under
> 40ft!). [...]
> --
> *Mike Waters AA4MW/7 waters@dover.sps.mot.com *

This is a common misconception. Higher does not necessarily mean better at hf frequencies. The pattern of an antenna will change as its height above ground changes. As you increase the height of a dipole, you lower the radiation angle of the primary lobe. Therefore, if the DX station signal you are trying to hear is arriving at a high angle, a lower antenna should be more effective than a higher one. We observe this situation daily on 14 MHz at midday when D-layer absorption filters out much of the low angle radiation.

What is a high antenna? a low antenna? The radiation pattern of an antenna is related to its height abover ground in wavelengths. An antenna 70 feet high would be considered low on 7 MHz (1/2 wavelength above ground) but would be considered high on 28 MHz (two wavelengths above ground). This is why Mike's numbers (240 feet, 40 feet) are nebulous. Doubling the height of a dipole for 3.5 MHz from 17 feet (about 1/10 wavelengths) to 35 feet (about 2/10 wavelengths) won't do much because the changes in the pattern are negligible.

1849. rs232 control for ICOM radios

Newsgroup: rec.ham-radio
Date: 1989-07-31 15:11:38 UTC
From: grossman@bbn.com
Message-ID: <43525@bbn.COM>
Source record: 17818
Cross-posted to: rec.ham-radio,rec.ham-radio.packet,sci.electronics

After reading article in August '89 "73 Amateur Radio" page 34
"Control Your Rig from a PC" my brother KA1PPG (without usenet access)
asked if its do-able on his rigs. I've read both manuals on his
ICOM IC-740 and IC-251. It seams not possible on the 740 since the
only leads that are come close are:

pin # Description

11 Input for TRANSVERTER control. When 8 Volts DC applied, the
set can operate with a transverter.

12 Output reference voltage for band switching
13** Output for external band switching

It seams do-able on his 251 because it has the following connections
on the ACC connector:

pin # Description

16 Control signal (DBC) input terminal for external control
17 NC
18 NC
19 Control signal (DV) output terminal for external control
20 Control signal (RT) input terminal for external control
21 Data signal (DB1) input/output terminal for external control
22 Data signal (DB2) input/output terminal for external control
23 Data signal (DB4) input/output terminal for external control
24 Data signal (DB8) input/output terminal for external control

Now the article mentions that some radios have an input and output
that are 5V rs232 signals but neither of these do.

So can someone explain (or point me in the right direction) how to use
pins 16-24.

PS I can easily make my brother a board like mine that uses an 8255 PPI
chip for digital control, if thats whats needed.

This was to Bob Voelker but somehow the mailer doesn't recognize his address.

Bob
About 2 weeks ago I got the Realistic DX440 and am having fun with it. One problem I have found is that 3khz down has an annoying 60hz-like buzz. I have no flourescent lamps or power transformers near the receiver and even when I disconnect the power adaptor it still has that buzz.

I would like to get the tech manual that Radio Shack has for the 440 but after looking at the owner's manual I am not sure that it would tell very much. It is very skimpy on all the functions of the little jewel. It wasn't until I read a note from someone on the Info-Ham list mention that the Sangean 803 could use the band select buttons to set the radio up to scan just that particular band. I thought that it would have to scan the whole AM band! Have you found any other little nifty tricks for the 440?

Have you been able to use your 440 for RTTY or Fax? Guess I better run. Catch ya later Bob.

You did get the number wrong, Tad. The correct phone number is

913-345-1978

There's also a new Fidonet Node number: 1:232/11.

While shortwave listeners will find many useful files and messages on
the BBS, so will scanner owners, longwave experimenters, AM & FM DXers,
and satellite monitors. We cover the whole radio spectrum, serving
listeners and monitors of all kinds of signals.

In article <8907302005.AA22113@apg-tecnet.apg.army.mil> mgb@APG-TECNET.APG.ARMY.MIL writes:
+psuvm!msu.bitnet!17158ejg@psuvax1.cs.psu.edu (Eddy J Gurney) writes:
+
+>But even worse, they are also equipped with a new LASER-based
+>speed detection system which is supposed to be _impossible_ to detect due to
+>the extremely-fine beam it puts out, not to mention it is light and not a
+>radio wave.
+
+This is more than possible in theory as the military is already using
+range and rate tracking systems using lasers. However if the local law
+has this stuff it's a first to my knowledge. The dangers of this are
+rather awesome to consider since you'd have low powered laser beams
+flashing directly into a drivers eyes. One of the big worries for the
+military pilot is exactly this! The bad guy (either land, ship or air
+based) 'flashes' a high powered laser across the cockpit of an aircraft
+thus either temporarily or permanently blinding the guy. It is hard to
+develop goggles to filter this out since you can change the wavelength
+of the laser which then of course defeats the goggles. Think about
+trying to fly an aircraft with no eyes. Nasty stuff.

This did happen with a navy pilot near Hawaii about a year and a half ago.
Seems Russian trawler aimed it's laser at the plane, and the pilot was
temporarily blinded.

+
+Obviously though that is not going to be the intent of the policeman,
+however I would get VERY irate if I found out some jerk was pointing a
+laser in MY eyes! To jam something like this is not as hard as you
+might think.... you find out the laser wavelength and jam it in much
+the same fashion as you would radar. The concepts are basically the
+same. By the way, smoke generators are fairly effective against laser
+tracking (the idea is to diffuse the beam) so all you have to do is
+get one of those smoke generators from a WW-II PT boat and you have
+a great system. Of course this only works if he's behind you, but then
+all the cops will also be too busy handling all the wrecks you cause!
+I like it!

What would happen if you were to cut a sheet of plastic (like a tarp, drop
cloth, etc) into narrow strips, leaving one edge solid to place in your trunk?
Wouldn't this eliminate any solid surfaces in the rear, or keep reflections
from bouncing back to the source? If it's hard to imagine this, think of
tying hundreds of pieces of thin plastic strips onto the back of the car)
Sure it looks messy, but it would probably work.

+
+>My friends and I thought it would be neat to paint our cars with that
+>RADAR-absorbing paint they have, but now it would be useless. (And probably
+>look bad, too.)
+
+A Stealth Mustang huh? Good idea. Seriously though, there is no such thing
+as RADAR absorbing paint. There is LOW infra-red signature paint for
+reducing the effectiveness of IR tracking (not much choice in color
+and it is pretty ugly), and there are honeycomb designs for diffusing
+radar returns... but I've never found a radar absorbing paint.

What about mounting fur or some other "soft, fuzzy material" to the back of
the car. Mount a garfield tail, and claim it's all a prop!

"This is the United States calling.
Are we reaching you?" - Pink Floyd Justin Masters - jmasters@pcocd2.intel.com

1855. My Two Cents

Newsgroup: rec.ham-radio
Date: 1989-07-31 20:34:22 UTC
From: pjstopa@CRDEC4.APGEA.ARMY.MIL
Message-ID: <8907311634.aa12220@crdec4.apgea.army.mil>
Source record: 17823

I am not one who generally gets on the soapbox, but there have been a few issues lately that I'd like to add my two cents to. So here goes.

A. The no-code license

I'm for the no code license because you need to get your foot in the door in order to make the sale. When I became a ham, I just wanted to get a tech license so I could keep in touch with my wife considering I had an hour commute (hot pizza on the table when I got home would be nice). It took me twenty years to get up the guts to take the code test. Anyway, once I got my novice license, I tuned across twenty meters one night and heard all that DX. That was for me! Within 9 months of getting my novice license, I upgraded to advanced.

Once we get these people on the air they will upgrade. The hobby won't suffer because someone doesn't know how to dah-dah-di-di-dah-dah (one of the best lids I know has an extra class license). Let's face it- the twenty-first century is around the corner. Let's not get hung up on the romanticism of spark gaps from the old man's model T and walking uphill to school in two feet of snow dragging the old windham behind us. Evolution tells us that we must adapt or perish.

And let's get these people involved on two meters. Nothing was more frustrating than going it alone in the beginning. Most clubs have two meter repeaters, and the help you get is tremendous. Having access to this will help to keep the newcomer's interest.

After all, what kind of code test do you need to shoot a gun?

B. The confirmation of What's-her-name.

You guys must be un-American. The Republicans maintain that what is good for business is good for America. So if two megahertz of our spectrum is needed by business, then it must be needed by America. We hams should do our part.

1856. Re: Public perception of Amateur Radio

Newsgroup: rec.ham-radio
Date: 1989-07-31 22:14:02 UTC
From: barry@hprmokg.HP.COM
Message-ID: <13770020@hprmokg.HP.COM>
Source record: 17824

I have recently read a newsletter from my ARRL Section Manager indicating
that the elimination of the code requirement probably won't add
a significant number of new hams to the existing roles.

I also believe this. Most people believe that ham radio is "something they
used to do a long time ago". My neighbor remarked that "he was surprised
that people were still doing that".

The truth is, in today's "immediate gratification" mind set, most people
just don't find it very interesting. They'd probably rather be playing
video games or watching TV. The only way we could attract them to the
hobby is to cheapen it in order to give them some quick thrills.

Next, if the code is eliminated, the complaint will probably be: "The
written test is too difficult".

This argument is a parallel to one stating: "Why do I have to take
English (or philosophy/art/history/.....) in school when I am an engineering
major. I won't use it".

Yup, just another hoop to jump through but it keeps out the unambitious.

'Same thing could be said with my job. Well heck, you don't REALLY need
a degree to do the job, do you??

It's an indication that one put off immediate gratification and set one's
sight on a long term goal and pursued it until it was obtained.
'A counter to the "I want it all and I want it now" way of thinking
that is too prevalent in current times.

There is a sense of validity to each side of the "no code argument" but
the real problem is that people aren't as interested in talking over the
radio as they used to be. 'Similar to the days when children longed
to be locomotive engineers. Times have changed.

Maybe if we could transmit video games over the air at each other.... ;-)

> keys.

I hope so, too. It seems at times that this is what mightbe neeeded to
get a codeless license class through. Hooray to the ARRL for being a
leader instead of just a follower.

> Oh, I forgot. The ARRL proposal stinks of elitism as well. It shows
> a "keep these people off OUR band (2m), let them use the bands that WE
> don't" attitude.

I don't think it is the best way to go, but do consider that it is a
compromise to help increase the support and decrease the opposition to
getting SOMETHING of a codeless license as soon as possible. We can
fix the 2 meter issue later on if we have to.

There is ONE benefit of the 220 Mhz frequency floor, that being that the
demand for EQUIPMENT will be more for 220 and 440 (and maybe 900 and 1240)
Mhz stuff. Maybe the Japanese will more widely diversify their model lines
which the rest of us can buy just as well.

> think this one over again. 73

That was already thought of a LONG time ago, and was considered a
MANDATORY requirement. It is implemented in my proposal by allowing
for a SINGLE license to have TWO classes at the same time. Technicians
like myself will be grandfathered into "Novice + Technician" and will
have all the same privileges. My Basic class proposal (low power Tech)
can also be combined with a Novice ("Novice + Basic") thus preventing
someone who is a Basic Licensee from be trapped out of the HF track,
and allow them to go into HF from the entry level position.

I thought it over again, and it looks fine to me. 73's from KA9WGN

> having a good time down on 2 or 6, I think that would be a big incentive.

But the upgrade we are talking about is one requiring a code skill, by the
ARRL proposal (but not by mine). Most of the people getting a Communicator
(by the ARRL proposal) will probably NOT upgrade.

I really believe 2 and 6 were left out to reduce the opposition it will get
at the FCC (which surely does not want another room full of comments filed).

> I guess my real point is (and I have said it before) we need to get more
> 'warm bodies' into the hobby. Those who come in under a no-code licence will
> have a chance to taste what amateur radio is all about, and will want to
> upgrade and continue to participate. If they have no interest, they will

Many will. Those who would have to do it this way because WE failed to
properly promote the ham radio hobby we have now. Novice is an excellent
way to get started in ham radio if you are interested in this aspect of the
hobby.

Many others WILL be content with VHF/UHF access (maybe wanting 2 meters) and
will NOT upgrade, but will renew in 10 years.

> to the hobby, though the interest is there. If we can get them in to the
> hobby, they will find out for themselves wheather they like it or not, and
> if they do, the code is worth learning..

Some will. Others just aren't interested in THAT aspect of the hobby at all,
which is why they see the code requirement as being so stupid in the first
place. Those you are talking about were the ones who just could not put in
the time or effort to learn it. We need both groups. Just don't get the
idea that the group you speak of is the only one around.

The two times I tried to use them (very delayed flight finally gets into the air and you want to tell someone when to expect you) they didn't. All I got was some message saying that the system couldn't connect my call right now. "Right now" lasted through several tries during the flight.

> fred k1io

Well, yes, as a matter of fact. I happenned to be driving through Nowhere, Nevada two weeks ago, when I came across the scene of an accident. About ten motorists had stopped to help this guy who flipped his Triumph Spitfire. There were three CBs and one Cellular Phone present. Emergency calls on the CB returned obscenities, and on the CP, static. Since I don't have a transceiver in the car (that will change real soon), I couldn't do much except help flip the car over. However, about five minutes later, someone with an N7 call happenned by, and managed to get the Highway Patrol and an ambulance on the way.

Yes, CB does improve in rural areas, but not by much. It's useless in metropolitan areas.

And yes, morse code is a lousy discriminator between yingyangs and useful folk. Hopefully, tougher testing will be a better one.

While on the topic of radar jamming, I thought I'd throw in a few notes.

Most radar guns in use today have an ERP of about 800 mW. Some of the older units, particularly X band, have an output of about 4 watts. Typical input power into the antenna is around 50 to 250 mw, if I remember correctly. Coming up with a transmitter/antenna combo to approximate these numbers isn't particularly difficult. Also remember that you don't need an where near this much power, since the police radar units are sensitive enough to pick up the REFLECTIONS off of a car, so you don't need to transmit with as much power as the police radar unit actually puts out. Taking into consideration path losses and the actual amount of RF that gets reflected off a car, probably about 100 mW ERP would be more than enough.

One other thing to think about: moving radar units deal with 2 different signals: one reflected off of the road, trees, and other stationary objects that determines the patrol car's speed, and one that is reflected off the target vehicle. It would take a combination of electronic trickery, physics, and luck to be able to transmit a signal that will produce both readings on the radar unit's display at the same time that would yield usable results.

The biggest manufacturer of radar units, Kustom Electronics, encorporates soemthing they call "jammer detection" on their pulsed radar units. They have it set up so that if the receiver hears a signal while the radar unit isn't transmitting, it lights up a "jammer detection" light on the panel. This probably isn't all that accurate, nor even payed attention to by the radar operator, but it's something to think about as well.

A couple of years ago, Car and Driver did a study on about 8 of the jammers that were on the market. None of them was anywhere near foolproof. There were two types of jammers tested: ones that emit microwave "noise" to hopefully confuse the radar units into not displaying a speed, and those that modulated a carrier to correspond to a particular speed that would appear on the radar unit's display. The jamming type were effective at far distances (typically greater than 1000 feet). The dial-in ones were more effective at closer ranges. All in all, none were really worth the money or the risk.

By the way, I'm not microwave engineer, so if I've made a gross mistake in any of the above info, give me a break.

> fred k1io

You should come out and hear some of the stuff on channel 23, here in Newark DE. If your lucky It's just abusive, but it's abusive at 200 watts or more.
Some one sent me mail (out going mail is broke at this end) about how CB'rs would not put in the technical resources to stay with the hoby. I know for a fact that this crew, on channel 23, puts in a lot of resourses, mainly to exceed power limits and step all over 22 and 24 as well. This is the same kind of crew that loves to brodcast, especially heavy metal.
Now it's not all bad. Sometimes it's even entertaining. But, some day, when I find the time, I would like to learn the code and get involved with Ham Radio. My modivation is the fact that most of the trific I hear in the Short wave bands is fairly orderly(with a few notable exceptions), and the people you work are really interested in Radio. Now if techincal knowlege becomes rigorously tested then perhaps codeless radio might not be so bad, but there would certainly have to be higher standards for technical knowlege.

> entry level ticket.

What does this mean? For it NOT to be an "entry level ticket", there would have to be a level below it. You want to make having one of the other code'd licences be a requirement? That would certainly make it a "non-entry-level-ticket"!

Perhaps you really wanted to say that you want a multi-tier'd no-code licence, with the ARRL's at the bottom, and with some of it's restrictions (like power and repeater control) reduced with a "higher" no-code licence.

I have a question for all of you on the net.

Here in the northwest we have what is called the
Evergreen Intertie, which is basically just a network
of 20 some odd repeaters on 2m and 440. These machines
are linked together on microwave trunks, and each machine
can independently be linked on or off of the trunk.

I am curious as to what other groups have put together similar
system. I know there is one in the southwest which is called
the "cactus system", but I don't know much about it. It might
be interesting to those on the net to see how many other networks
are out there in VHF land.

There wasn't any Gunn diode/Antenna combinations with 4 watts ERP, I doubt there is today? Are you sure? Are you thinking of the tube systems back in the 60's that fit in the trunk? :-)

> Also remember that you don't need anywhere near this much power, since the
> police radar units are sensitive enough to pick up the REFLECTIONS off of a
> car, so you don't need to transmit with as much power as the police radar
> unit actually puts out.

This is true as long as you transmit exactly @1727 kHz above the police X band radar with a CW signal for 55 MPH. These things drift all over the place, so you must track it to some ungodly precision. What the AM jammers try to do is substitute both the carrier and the sidelobe doppler shift information, overiding the units own doppler measurement. This is why they only work at close range, and require lots of power; just as much as the radar or more.

> One other thing to think about: moving radar units deal with 2 different
> signals: one reflected off of the road, trees, and other stationary
> objects that determines the patrol car's speed, and one that is reflected
> off the target vehicle. It would take a combination of electronic
> trickery, physics, and luck to be able to transmit a signal that will
> produce both readings on the radar unit's display at the same time that
> would yield usable results.

The moving radar still only measures relative velocity. The readout displays the difference between your speed and the cops, whether he's at 0 or 60, it makes no difference. The tracker locates the cruiser velocity and subtracts that out. You therefore still jam with 55, or 1727 kHz above the measured carrier frequency. For example the cruiser going 60 and you going 55. You jam the radar at Fo + 1727, he then subtracts his speed and your still left with 55. But were not using that type of jammer (spot), were using AM. An interesting point though is if your jamming, the tracker may not have enough information, so the screen will appear blank. After all your 55 jamming signal is 5 MPH below the cruiser if it overides the radars doppler measurement.

> A couple of years ago, Car and Driver did a study on about 8 of the jammers
> that were on the market. None of them was anywhere near foolproof.
> ...
> The noise jamming type were effective at far distances (typically greater
> than 1000 feet). The dial-in ones were more effective at closer ranges.
> All in all, none were really worth the money or the risk.

Case closed, buy a detector. Also buy a detector if you don't speed. Last year the hick-town north of me "Valley Brook Oklahoma" took their uncalibrated (defective) radar into Oklahoma City (it borders all sides of the town) and issued over a thousand tickets. There was a big investigation and their lack of records were a joke. Lots of money changed hands. Then theirs the speed trap; a 25 MPH sign 500 feet after the 45 MPH sign. I never noticed these until I bought a detector.

The only thing Amateur Radio about this is the term X band :-)

I have watched with great wonder the debate over code or no code in this distribution list.

Like others I am interested in obtaining my license. I will attempt to learn CW and would do so even if it were not a requirement. But ham radio is only one of the areas I am interested in. I will not be narrowly focused on talking to others about the latest transmitter or what the weather is. I will use ham radio as a tool for other areas of interest where I will combine radio, computers, astronomy etc etc.

An analogy might be in order to show just what I think of the argument supporting a strict code requirement. As most users subscribing to this list I work many hours on a large computer system. Because of the vital nature and complexity of computing, I propose that there be a license and a testing scheme for anyone who operates a computer. I base my argument on the fact that computers are as complex as ham equipment where licensing is already required. Computing has a systematic set of theories for both the physical hardware as well as the software which makes it work. Also, the use of computers has a great potential to impact others in many ways, i.e. RF generation, collection of data which would violate an individuals civil rights, or more subtlety a computer user can effect the integrity of essential national interests of basic research and defense data through tampering with computer networks. Thus every one who wants to operate a computer should be required to pass a comprehensive test which covers the scope of electrical engineering design, computer operation, and should pass a high level of proficiency in COBOL. Some might argue that COBOL is outdated and that we should require proficiency in C. But I will point out that COBOL is mature language which has a standard means of providing instructions to the computer and was one of the first languages developed.

If there had been restrictions of this nature during the early days of microcomputing we would not have had the advances made by computer amatures which are finding their way into all aspects of computing.

It is my opinion that those who are advocating a strict code requirement are also advocating the stifling and eventual death of ham radio.

>> doubled by doubling the height (its more than that for heights under
>> 40ft!). [...]

>This is a common misconception. Higher does not necessarily mean better
>at hf frequencies.

Actually this is more a problem of giving a general "rule of thumb"
intended as a rough guideline and having it taken as the "literal word of
God". There are many many variables, but it is rare that a significant
change in height will worsen the situation even though the difference may
not be very much.

About the only situation in ham radio hf work that a high angle is actually
helpful is Mass. to Europe, where 60 ft is about the peak performance for a
3el beam. Longer haul stuff still benefits from a 120ft+ height.

The other assumption I probably should have mentioned is the effect of
antenna type. I was assuming at least a "mini beam" on 20/15/10M,
obviously these heights are doubled on 40m etc..

In general a beam type antenna degrades rapidly below a certain height, a
5el wide spaced beam should be 1 wavelength or more high, the avreage
tri-band beam 1/2 wl (approx 60 ft for 20M), etc.

A quad or dipole will work well at 20 ft or less, but still improves with
height although not as dramaticaly as a beam.

>The pattern of an antenna will change as its height
>above ground changes. As you increase the height of a dipole, you lower
>the radiation angle of the primary lobe.

Over real "lossy" earth much of this lowering is gained from less ground
loss. A dipole is worst case for this BTW.

>Therefore, if the DX station
>signal you are trying to hear is arriving at a high angle, a lower
>antenna should be more effective than a higher one. We observe this
>situation daily on 14 MHz at midday when D-layer absorption filters
>out much of the low angle radiation.

True, but if the lower angle is there it will be much stronger. This is
usually the case when the band is just opening or closing. This effect is
important for a DX station to reduce the area of coverage and cut down the
pileup to something manageable.. It works in reverse to, for any country in

the world Arizon has about a 10-20 min/opening advantage over California. Obviously this is much more important to our west, but is still important.

>What is a high antenna? a low antenna? The radiation pattern of an
>antenna is related to its height abover ground in wavelengths. An
>antenna 70 feet high would be considered low on 7 MHz (1/2 wavelength
>above ground) but would be considered high on 28 MHz (two wavelengths
>above ground). This is why Mike's numbers (240 feet, 40 feet) are
>nebulous. Doubling the height of a dipole for 3.5 MHz from 17 feet
>(about 1/10 wavelengths) to 35 feet (about 2/10 wavelengths) won't
>do much because the changes in the pattern are negligible.

All quite true, but as a rule of thumb assuming an appropriate antenna type for the height it does work that way.

Moving a dipole from 17 feet to 35 feet will probably produce much more gain because of reduced ground coupling (read: house wiring, roof material, etc.) There are a lot of effects here and pattern changes are only one of the effects.

Unless there is some unusual propagation or "relatively short" distances then the lower angle radiation and reduced ground losses are always beneficial. Of course if you bury a bunch of radials a vertical has the best pattern of all ...

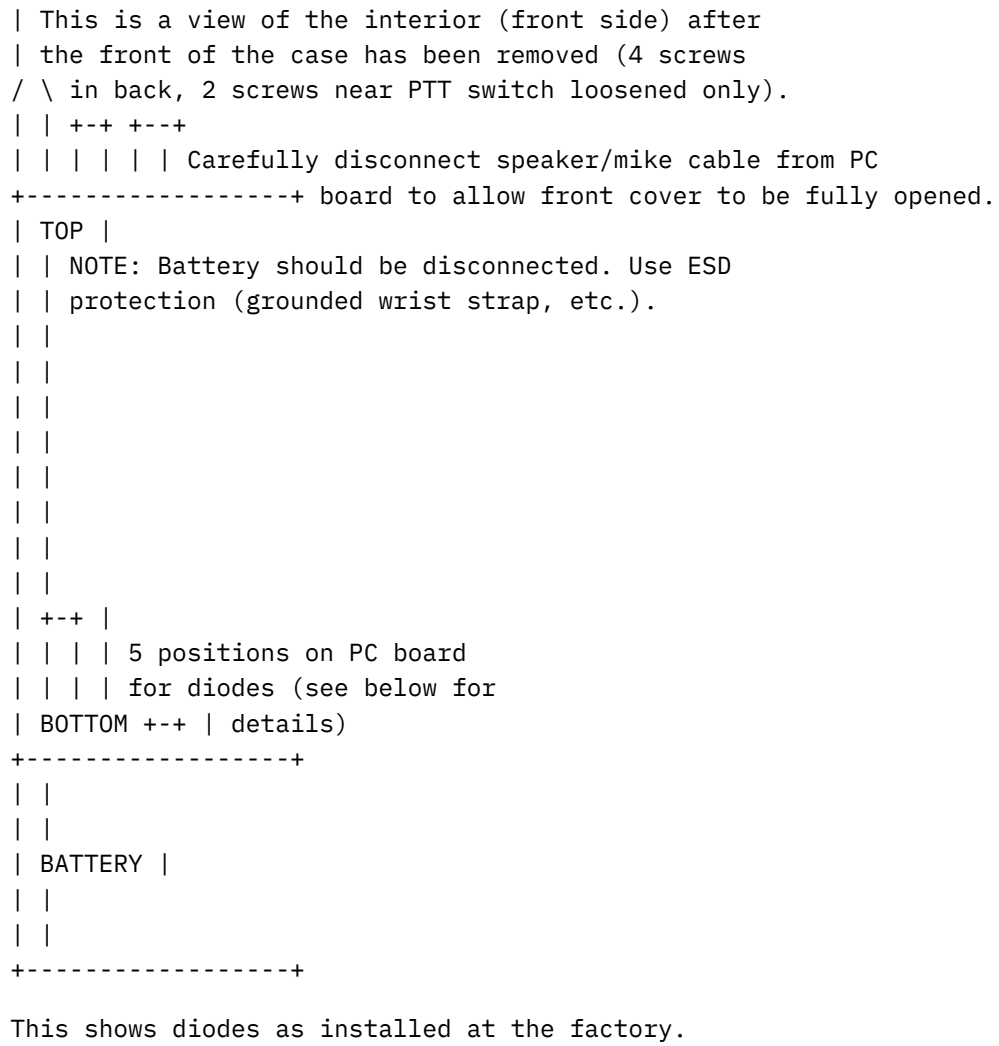
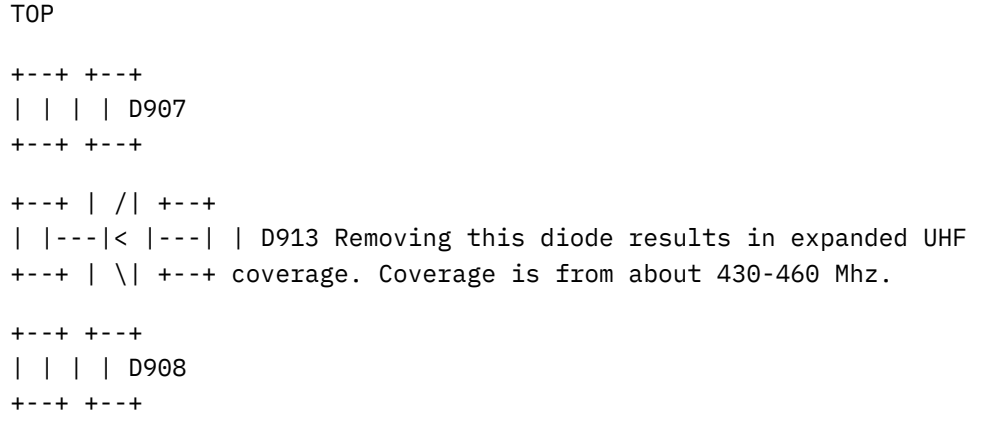
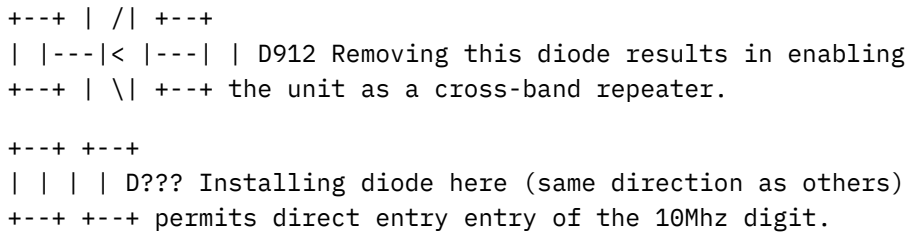
Originally prepared by N0ION, modified by N0AMP.



This is a view of the interior (front side) after
the front of the case has been removed (4 screws
in back, 2 screws near PTT switch loosened only).
Carefully disconnect speaker/mike cable from PC
board to allow front cover to be fully opened.
TOP
NOTE: Battery should be disconnected. Use ESD
protection (grounded wrist strap, etc.).
5 positions on PC board
for diodes (see below for
BOTTOM
details)
BATTERY

This shows diodes as installed at the factory.





D912 Removing this diode results in enabling
the unit as a cross-band repeater.
D??? Installing diode here (same direction as others)
permits direct entry entry of the 10Mhz digit.

BOTTOM

Icom Service Bulletin #13889-005

The IC-32AT has the capability of being used as a cross-band repeater.
This function is not enabled as the unit is shipped from the factory.

To enable this function perform the following steps:

1- Cut D912 on LOGIC UNIT. (see above figure)

2- Push and hold the (FUNCTION) switch.

3- Push the (C) key.

4- Push the (6) key.

5- Push the (D) key.

6- Release the (FUNCTION) switch.

To cancel "MINI REPEATER" perform the following steps:

1- Push and hold the (FUNCTION) switch.

2- Push the (D) key.

3- Push the (C) key.

4- Release the (FUNCTION) switch.

I HAVE USED a 40 meter dipole on ALL bands 160-10 with decent results. I fed it with tv twin lead at a power level of 100W thru a tuner.

The same will work for any band dipole, with the understanding that performance will suffer on the bands for which the antenna is too short. RF feedback problems are less with balanced antennas -- my antenna feedpoint was only about 7 feet above the rig, anbd I never had any problems.

I am suprised they can get away with this. Here at Boeing, whenever there is a laser in the same room as you are, even a low power one, we all have to wear these goggles which prevent light at the laser's frequency from entering our eyes. These goggles are not cheap either.

Now, are they going to provide free laser eye protection goggles for all the drivers or risk **massive** lawsuits for eye damage?? I think, if this is true, thay they are playing with fire.

The Cactus System is very widespread in the Southwest, but unfortunately
it is a CLOSED system. At the AZ repeater owners meeting (which controls
coordination) last weekend, I put forward a proposal to not coordinate
repeaters as closed. Sadly, it was defeated.

Anyhow... we have the ZIA link system here that has two meter repeaters
on link from west Texas to the California border. It is an OPEN system
and is popular with travellers and truck drivers (including bootleggers).
A small group of us operate the Northlink OPEN system in Arizona
that runs from the Phoenix metropolitan area to Flagstaff, and is
then linked to a high altitude repeater on Navajo Mountain in
southeast Utah.

1878. Wrap up on "S-Band Beacon on the Moon"

Newsgroup: rec.ham-radio
Date: 1989-08-01 15:40:43 UTC
From: wjc@XN.LL.MIT.EDU
Message-ID: <1499@xn.LL.MIT.EDU>
Source record: 17689
Cross-posted to: sci.space,rec.ham-radio

I have finally found the reference to which I alluded in my original posting. It appeared in QST magazine, November 1981, in the "New Frontier" column.

It stated that at the IARU (International Amateur Radio Union) Region 1 Conference held in the UK in April 1981 it was decided that:

"For EME [Earth-Moon-Earth or moonbounce] work at frequencies above 1 GHz, transmitted signals should have right-hand circular polarisation, except on 2.3 GHz where the standard is left-hand circular. It may be noted that reflection from the moon causes a reversal in polarisation so that received signals will be left-hand circular, with again the opposite on 2.3 GHz. The reason for 2.3 GHz being the odd man out is that advantage can be taken of the 2276-MHz beacon left on the moon during the Apollo program. This beacon has already proved useful in testing antennas and 2.3 GHz receiving systems, but unfortunately it transmits right-hand polarised signals, and so the standard was reversed for 2.3 GHz."

The above blurb was credited to the RSGB Radio Communication magazine for July 1981.

From the weight of responses to my original posting, I do, however, surmise that the beacon was shut down sometime after April 1981.

in INFO-HAMS Digest V89 #520 <Phil@ux1.cso.uiuc.edu> says

>There is ONE benefit of the 220 Mhz frequency floor, that being that the
>demand for EQUIPMENT will be more for 220 and 440 (and maybe 900 and 1240)
>Mhz stuff. Maybe the Japanese will more widely diversify their
>model lines which the rest of us can buy just as well.

Surely this is missing the point. It will just encourage the
'Appliance operator' syndrome which is not what we want (is it?)
Make the renewal of the 'communicator' license (or upgrade if thats
what the licensee wants) dependent on proof that the person is
competent - i mean actual hands-on, get-out-the-oscilloscope ability!
Forget written tests only - after all you dont let drivers loose on the
road with 2 tons of metal on the basis of only a written exam do you?
(but having visited Florida, i begin to wonder.....!)

Also, why not make it lapse after a year/three years?
And make it renewable only *ONCE* That would motivate them to upgrade!

Just talked to Bob at Radio Engineers regarding their advertised VHF direction finder. He has very good things to say about it, of course, but I wonder if anyone out there has used it?

It's basically a simple double-ducky direction finder, with built-in attenuator, adjustable dipoles and a compass, for $124.95, or a deluxe waterproof model for $179.95. Looks reasonable, given the cost of manufacture, advertising, engineering and so forth.

>>Why don't you just go the speed limit? Going 10 mph faster is only going
>>to make a few minutes difference in your destination time anyway.
>
This is degenerating...but since you asked....:-)

Especially on two lane highways [like rt95 around here], I like to go
the speed of the traffic, which is 60-70 mph. I use a detector
because this is over the speed limit. If I happen to be the first
guy around the corner, after a trooper has just written up the last poor sot,
I'll get nailed for 65. Or if the trooper is in a bad mood, doesn't like
my looks, etc, etc.

Mr. State Trooper can basically pull over anybody he wants to. Everyone is
going 55+.

Another reason I use the detector is that often on secondary roads you'll find
some pretty ridiculously low speed limits (like 25, where everyone goes ~40) and
if you happen to be asleep at the switch you'll also get nailed. Again, I don't
think I'm being unsafe, I just like to go the speed of the prevailing traffic.

Of course I _bought_ the detector in my foolish days were I went too fast, but
I find it still gives me piece of mind to know when I'm being zapped. Besides, its
my 10Ghz rig, :-)

> Ever seem to you that the people who are really against code
>are the ones who don't want to use it? I am always hearing
>the argument "I don't ever use CW so why do I have to know it?"
>etc.

Actually, I'm one of the louder pro-nocode flamers on this net.
But you have a decent shot of hearing me around 14.010 or 21.010, since
that's where the DX is. Y'see, I think CW is a neat mode of operation.
But morse testing is killing ham radio's growth rate. It's lousy
marketing, and we can't afford such a low growth rate any more.

> Well, I personally don't forsee ever using SSTV for example
>so why did I have to study all that technical and regulatory
>stuff? Why not only test on things we like and intend to use?

I'd be perfectly happy for SSTV and CW to get equal billing on the test.
After all, you only need about 3/4 right. So if you know zilch about
SSTV but know everything else, you can still pass. If CW were just one
more mode, with "what is dahdahdidit?" just another question (say, 15%
of the total), I'd be satisfied. But you don't have to pass an SSTV
test per se and then a test on the other modes. Morse stands alone.

>Why all the fuss about passing a few tests? People from 8 to 80+
>have done it so it can't be THAT bad.

No fuss about a few tests, just about making one test (morse) an
absolute requirement when it's clearly not as important as it used to
be, and is offending many qualified people who otherwise would get
tickets.

> If we remove the code requirement then it WILL be CB. That's excactly
>what happened to the Children's Band on 11 meters.

Hmm.. Lets see, to 'get into' CB all you have to do is have enough money to go buy a radio, an antenna, some coax, and either (1) hook it up yourself or (2) pay someone to do it for you. Oh, yes, you also have to make up a name to call yourself. Yup, sounds *exactly* like the licensing procedure proposed for the codeless class of ham license.

(Oh, come on now, surely I don't need to state the obvious?

Oh, ok: :-) :-) (-: (-:)

> I've also heard some abuses
>on 75 meters this year and I'm glad to have these requirements to help keep
>that kind of eliment off the air. We have standards to maintain.
>
> Paul

Well, I don't have all the HF freqs and privs memorized (thats why I keep an up-to-date FCC rulebook from the ARRL handy at home!), but I KNOW that I, as a Tech, don't have voice privs on 75m, and I seem to remember that you need 13wpm (at least) to get those privs (maybe you even need to be extra, I dunno, the books at home, and *I* certainly have no use to remember all those stupid band edges for everybody else). So, there are abusers on the air as it is. I wonder how much abuse is from those who have passed a higher-than-5wpm code test and how much is from Novices and Techs? It would be very interesting to know, then we would have some real solid numbers (but see note below) to argue about. I have a feeling that the N/T population either has no different rate of abuses, or perhaps a bit lower. ("Not statistically significant to alpha = .05", as they say :-).

Note: (this is the "see below" part)
As a well-known personality has said, there are lies, damn lies, and statistics. All statistics should be viewed with reservation. The method of taking the sample, the way in which the questions are phrased, and even the personality of the person doing the questioning (for interview style surveys) all can have a very marked effect on the outcome. And that is before someone goes in with the purpose of manipulating the numbers to get them to do what they want. Which, unfortunately, does happen. It is even worse when the question-designer intentionally (or innocently) writes questions which will bias the result (e.g. "Are you against abortion even in cases of rape and incest?" being reported as "99% of

the U.S. is against abortion". And you may send your flames to /dev/null on that one, I've seen an abortion group doing that very thing. Sure, it was not 99%, but it was very high, as you would expect! The whole point is, if you want a certain answer, just be careful how you word the questions and you can get just about any result you want.)

Anyway, the point of all the above is that it seems to me that neither knowledge of code *NOR* knowledge of theory really has any bearing at all upon whether or not the prospective Ham will be a jerk on the air or not, nor even if that person will bother to obey the laws governing their radio activities! (In fact, their being 'good folks' on the air does not even mean that they are law-abiding in other areas. What about the gentleman (?) who lost his DX award because he was running something like 3kw (or more)? (This may just be a false rumor, but 'my source' was pretty adamant about this person's activities). Maybe we should change the rules to make people take some kind of 'niceness' test? How about 5 letters of recommendation from other hams? How about a letter from God himself? No? have I made it obvious yet the futility of using technical or skill tests to test for personality traits? I sure hope so, 'cause I gotta go now :-)

73 and all that! Please read the above with a smile, not a flame nor a frown!

> Ever seem to you that the people who are really against code
>are the ones who don't want to use it? I am always hearing
>the argument "I don't ever use CW so why do I have to know it?"
>etc.

As far as I knoe NO ONE is "against code", just against a universal CW test.
There is a difference. I think you will find most of the no code licence
supporters here are quite well qualified in the area.

I for one have over 200 CW countries, passed the Extra class and can receive
35-40wpm. I enjoy CW, but I also enjoy SSB, FM, Packet etc. etc.

Perhaps you have some reason for continuingf the CW test when it is no longer
used in many areas of ham radio (to say nothing of the commercial/military
side).

> Code may be hard to learn if your heart isn't in it..agree?

How hard it is to learn is irrelevant, personally I don't think you can
really "know CW" until you can operate at 25 wpm or more (thats carry on a
QSO, not just copy or send). Very few hams take the trouble to get that far.

> Well, I personally don't forsee ever using SSTV for example
>so why did I have to study all that technical and regulatory
>stuff? Why not only test on things we like and intend to use?

So you know when you CAN do it. What is your point?

>Sounds like the train of thought I keep hearing from the
>no-code advocates. Amateur radio gives us priviledges and
>responsibilities that I don't mind studying for... guess not
>everyone wants to be a part of the whole.

Sounds like a vague put down to me, the argument is not for a "looser"
license, but for one that is relevant to today's conditions and operating.

How about substituting a voice operating procedure test for CW?
Like the ones the FAA gives to pilots.

>I have been licensed for 10 years.

I have been licensed for 28 years.

>I work CW only, because I
>really enjoy it. I was a single mother with 3 kids (2 in diapers)
>when I got my first ticket, which was an effort for someone who
>had no idea what a "ham radio operator" was, let alone a diode.

I was a high school student and worked CW because I couldn't afford an AM phone rig (SSB was even more expensive). My equipment was mostly rebuilt "console radios" from the 30s and WW-II surplus stuff. It worked.

>Why all the fuss about passing a few tests? People from 8 to 80+
>have done it so it can't be THAT bad.

Good idea, how about a retest for everyone? And lets include some of the subtleties of DX hunting etc. just to make it interesting. Like where and when to listen for a UB5?

>Enough said.

Not nearly enough IMHO.

I see absolutely no justification for this kind of snobbish elitism. The ham bands are not the private preseve of a privilaged few, but belong to everyone. If most of the peopple who could contribute to (and learn from) ham radio simply aren't bothering then ham radio is failing in its primary purpose - enhancing the skills and knowledge of the population.

The FCC and FAR regulations seem to me to be appropriate as they stand. Those in charge of an aircraft, who are responsible for the safety of the passengers on board (and flight crew, too) need to have the responsibility AND authority to be certain that nothing compromises that saftey. I'd rather spend my time prohibiting smoking on all flights over US territory.

Cross-posted to: rec.audio,sci.electronics,rec.ham-radio

Hello there audio whiz-ers and philes!

I recently got a turntable, which I know little about:

Optonica Model No. 1414 MK II
33/45 speed - belt drive - automatic turntable
made by Sharp Electronics

Any ideas on when these were made?
Is this a good quality turntable?
What type of cartridge should I use in it?
Does anyone have instructions on how to adjust the
weights - tracking force and (I assume) anti-skating?
Anyone still have a manual which they could photocopy
and USMail or email the instructions?

Thanks for your help - Ihor

Well, the riff-raff you seem to dread have gotten through even with the code requirement; in fact, they must have passed at least 13WPM to be on 75M, so I really don't see how the code requirement keeps them out. I've heard apalling behaviour on 75M, 40M, 20M, 2M and 70cm. You know what the funny thing about these people is? They all have had at least a General class license, and the number of Extras among them is high.

These "undesireable" types can get in as it is.

Source record: 17719

Franz Delahan (WC6Z) (uci-ics!jrs1!franz@cs.ucla.edu) says;

<...My Yaesu 757GX tranceiver seems to be very sensitive to RF-feedback...>

At last! Someone else. So does mine. The damn thing goes into
self-oscillation if the merest sniff of RF is in the shack. It also gets
confused by amounts of 144MHz - I use it to drive a transverter, and if I
have my 144MHz linear on as well, I have to pull the packet connections
(audio in & out, PTT, AGC) otherwise I get reports of unreadable audio.
(Can't run the linear on packet. Sniff)

I've looked at the circuit diagram, and all the (non-RF) connections on the
back seem to be decoupled internally, but it doesn't make any difference.
The dealer claimed to be unable to replicate the problem, so I'm stuck with
it. I just make sure that there's NO RF in the shack. (Use counterpoises).

73,

Hugh, G0CNR.

Message-ID: <02.Aug.89.10
Source record: 17720

Passive police-radar avoidance - well, i wonder if the disruptive reflections
from a number of dipoles mounted on the engine cooling fan (on my car
the fan is plastic, it sits in front of the radiator behind a plastic,
RF-transparent grille, and i could easily 'paint on' some
1/2 wave sections using conductive paint). might be worth the effort?
European speed traps seem a bit different to the ones used in the States - we
have:

'Muniquip' - hand-held radar guns - very inaccurate due to all the reasons
posted previously. Buildings timed at 70MPH, trees at 15MPH.

'Gatso' - on-board police car radar system - the police cruise down the
highway at the legal limit, in an unmarked car, with the Gatso radar
turned on. It detects any vehicle approaching from behind,
and tracks its speed, then as the speeding car pulls past the police car,
takes a photograph of your license plate, and along the bottom
adds the time, date, speed and location.
An infra-red flashgun mounted on the front of the police
car allows use at night.
Because it relies on a constant radiation to trap people, it is rather
easy to detect, and you hit the brakes before you go past the cameras!
'Truvelo' and 'Archangel' are also used - these are systems based on
photoelectric cells and/or induction loops buried in the road and/or the
police measuring a section of road - they arent radar systems.

In the UK, photographic evidence is now accepted by the courts - the police
send you a photograph together with the summons and you have to pay up! The
police do not levy on-the-spot fines, all you know about being caught is when
the brown envelope drops in your mailbox.
Some people have been caught several times in the same day, and have
lost their license as a result.
Apparently, some people have developed light-polarising sprays to put on
your license plates so the plate appears indistinct to the police camera,
it has been suggested that certain brands of hairspray also have
the desired effect - why build a jammer when you can buy an avoidance
system in a can from your local drugstore?

From: dls@genrad.com
Message-ID: <24273@genrad.UUCP>
Source record: 17722

Hello, All, again! I just wanted to announce that I now have the Technician Ham Stack completed, as well as the previously announced Novice Ham Stack. These two Hypercard stacks are 25 and 30 question interactive tests, respectively, each set contains the entire question pool put out by the ARRL. These are great practice for taking that next test.

Since Tom Sefranek (WA1RHP) and Norm Kashdan (don't know his callsign) supplied me with two boxes of diskettes for giving away to hams (and prospectives), I will supply the first 18-20 requests thru email requests. Realize this doesn't pay my postage though. In general, if you want copies of the tests, send a Self-addressed Stamped envelope and 800K diskette and I'll send you the files. Before anyone asks, NO I CAN'T POST IT TO NET NEWS. My Mac is at home, I'm at work and I don't have facility for transferring Mac files to the system at work.

For information of a more personal nature, I will be taking the ham test(s) on September 6, so then I'll be a ham too. Meanwhile, I'd like to thank all those who have helped get me going, one of which even supplied a radio for temporary use! Thanks much, WA1RHP, W1WYC, K1KAY, and K1MVN.

>marketing, and we can't afford such a low growth rate any more.

Fred, you have cause and effect reversed:
Lousy marketing is indeed ham radio's problem.
Morse testing is not lousy marketing, though.

Proper marketing would sell ham radio enough that people would accept
the Morse requirement and get the license.

I am relatively new to SWL. I recently purchased a SONY ICF-2010 from my father, who only had it for a few months. He decided it did more than he really cared for, so he sold it to me for $290, and it's only a few months old. I have several questions.

Is this a good price? From what I can tell, it is. The list is $389 I believe, but then, no one is foolish enough to pay list price. I have seen it through mail order for as low as $320. Could it possibly be even lower?

Is this a good set? I think it is. I stopped by my local shack (EEB) and one of the guys there said that it is probably the best mid-sized portable on the market today, and that they can't keep them in stock. He wanted to know how I got one!

What kind of antenna do I want for this thing? I am mainly interested in the AM band, 50Khz thru 30Mhz. I don't know enough about antenna theory to know what to use for best reception.
Are there any mods for the beasty? Thanx in advance for any help!

1901. A few more no-code thoughts

Newsgroup: rec.ham-radio
Date: 1989-08-02 12:39:26 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <158139@Wayne-MTS>
Source record: 17725

There are a few recurring themes in the code/no-code debate that I'd like to challange. Number one is "code skill is not a meaningful requirement". Well, it hasn't been really meaningful since AM became popular. For that matter, most of the requirements aren't meaningful in the sense of required skills needed to operate a station. If all we were concerned with was testing ability to run a station, the test would have two questions: (1) What frequencies are you allowed to operate? and (2) What is the phone number of your nearest AES outlet?

Ahem.

Another correspondant pointed out that he had to answer a lot of SSTV questions, even though he'll never operate SSTV. And the General test still asks how to dip and load a final- something most modern hams will never do. This leads me to ask, why have an exam at all? WHy not just hand out a sheet of does and don'ts?

We know the answer, of course. CW is, like most of the material we're tested on, yet another filter. More importantly, it's the *only* one you can't fake. I know more than a few Extras who, while they have better code copying skills than do I, have problems figuring out which cord plugs into the wall, and which into the antenna. I don't resent them; they've worked hard, they're serious, and, if you like, they jumped the hurdles.

That being said....I favor a limited no-code licensure. But why not make it simple, to begin with? Rather than new tests, new names for Techs and so forth, how about an entry level license consisting of Novice VHF and UHF privaleges? Pass the novice test w/o code, and you're a "Tyro" or "Communicator" or what have you. Try it out for a few years. If it works, we'll have lots of upgrades and new 1240 equipment on the market. If not, well, at least we won't have lost it all.

1902. Public Perception of Amateur Radio

Newsgroup: rec.ham-radio
Date: 1989-08-02 13:30:35 UTC
From: tiller@scr1.UUCP
Message-ID: <442@scr1.UUCP>
Source record: 17726

So you want to know the public perception of Amateur radio?
Have a listen at the a**holes on 14.313 going at each other
full blast. Or maybe the ones down near 3.850-3.910. I
(being an ameteur-in-training) find this behavior far from
gentlemanly and certainly not "good amateur practice." This
stuff is being heard world-wide, guys!!! All of the parties
involved are running full power, all the time, and are bitching
over the fact that no one owns a frequency. If you don't have
the courtesy to move if asked to (nicely!) by a net controller,
then get the hell off the air! Like it says in the rulebook
(The FCC Rulebook, ISBN 0-87259002-X, page 6-9) "It is far easier
for individuals to look out for the nets than it is for nets to
move 10 or 100 hams to other frequencies in a crowded band."
If you think amateur bandspace is a god-given right, then you've
got another thing coming - if this bullsh*t continues, the FCC
and/or government will solve the problem for all of us. Imagine
if this sort of junk were to be aired on a National News Show
such as the NBC Nightly News. Remember, the news guys no longer
have to ask your permission to re-broadcast amateur transmissions!

system. I know there is one in the southwest which is called

In the New England area there are 2 large networks. One is the New England Network, whick is mainly on 220. I don't know exactly how many machines are affiliated but it is a switchable network and when enough machines are linked I have heard that people in the New York city area can work into Canada.

The other network is the Worldnet. This is primarily on 440 with full time linked repeaters in Massachussetts, Rhode Island and New Hampshire. There is also a 10 meter repeater on the system on 29.62 (-.1 input). It normally is PLed with the New England PL of 131.8. In addition to reliable mobile communication the 10 meter link can be real interesting. It is kind of fun to work JA's with a HT.

More information about Worlnet can be had by a SASE to W1OJ in the callbook or email from myself.

Here in Western Michigan, we have several Two Meter repeaters tied together via 220Mhz links that allow us to converse anywhere on the West/Central part of the state. These links are dedicated and are very useful when you are out camping/etc in the middle of the woods. You still get a link to home for emergency/general communications.

Also, on Monday nights, we run a "Connect Michigan" network between 15-20 repeaters all over the state (and Northern Indiana). Repeaters on 144, 440, and 220 Mhz all connect together and a person can contact someone in any area in the state via their local link. This is useful if you need a topic of general discussion between groups in two areas, or if you need to get information to a larger group of hams. The net usually fires up after the ARRL bulletin that runs every monday night.

The large net doesn't allow autopatches, however, due to large numbers of machines being tripped, and a large demand for time. It is also manually hooked up/dropped. It sure would be nice to have a touch tone decoder keyed to link/unlink a machine with several other machines. Then you could dial up a "TRUE" switched network to grab just the repeaters of your choice.

1905. T-Hunting Equipment Sources

Newsgroup: rec.ham-radio
Date: 1989-08-02 14:42:14 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <158167@Wayne-MTS>
Source record: 17629

I've been chasing down some suppliers of equipment mentioned in the Moell & Curlee book, "Transmitter Hunting: Radio Direction Finding Simplified", and as others may be interested, I thought I'd pass on the info I've found.

1. Double Ducky Direction Finder kit- Circuit Board Specialties has this one for $27.09, complete with case- you supply the ducks. The correct address and phone are PO Box 951, Pueblo, CO, 81002 and (719) 542-4525. I've ordered the kit, and will post a full review when it's assembled and tested.

2. K6BMG SuperDF: Available direct from Russ Andrews, K6BMG. I had a chat with Russ last night and he told me quite a bit about the box. It's a phase-sensitive unit using 2 antennas. Output is both tone (high/low == right/left) and via two LEDs (red/green). Not cheap, but cheaper than a Doppler, I suppose. Many options, ranging from a kit at about $135 to a fully assembled unit at about $205. You also need an antenna, of which there are a few models for VHF (100-200MHz) and one for UHF. Antenna assembly kits are $50-60. Russ says he also has a prototype of a 4 antenna model that uses 4 bar array LEDs in a cruciform array to give (more or less) direct directional readout, and is also working on a remote indicating model for repeaters. Anyways, you can reach him at (818) 448-0796 after 5:30pm, CA time, or drop a line at 9935 Garibaldi, Temple City, CA, 91780. I may buy one of his systems...but not for a while. Real estate taxes are due this month :).
3. And now an inquiry: Does anyone know if (1) the DIck Smith Doppler is still available, and if it's been improved at all? One local user has a heavily modifed version which he say is still only so-so.

(Insert standard disclaimers here)

>
>Proper marketing would sell ham radio enough that people would accept
>the Morse requirement and get the license.

Maybe I used to believe that ten or fifteen years ago. But I certainly don't believe it now.

My place of emmployment, for one, is one of the world's largest centers of data communications expertise. Hundreds of engineers work here on comms-related matters. But I can interest hardly anyone in ham radio any more.

Ham radio is perceived as an anachronism. Our "packet radio" is over a decade behind the times, and offers greatly inferior performance (not to mention price/performance) to ther networking technologies, including this forum. DXing is an arcane sport, fun for those who like it but, like curling or orienteering or courts (all sports), not saleable to the masses. "Talk to the world" doesn't mean much when I can pick up my phone and dial France the same way I dial Maynard (the town eight miles away, not the splut). Mobiling doesn't mean much when cellular car phones are $217 at Fretter's and have no anti-pizza restrictions. VHF experimentation (and other hardware hacking) is neat but too many "kids today" are getting hung up on software alone as their version of engineering, and besides, even engineering colleges don't do much analog any more. No, it's not an easy marketing job.

But if you really want to have a clincher, to PROVE beyond the shadow of a doubt to a good engineer that ham radio is an anachronism, there's the code test. Case closed. C'mon up here and try it. I have.

How about "no more code than there is SSTV"? The SSTV questions deal with bandwidth, signal composition, allowable frequencies and so on. Nobody requires that you go out and buy/borrow a video camera and practice with it so you can pick up a strange camera at the test and make a tape (no transmitting without a license!) to prove you can use it.

But you do have to buy/borrow a key and/or tapes, code programs, etc. and "prove" you can copy (if not send) code. Why is CW the only mode that deserves proof of ability? Why not SSTV? Why not RTTY? Why not Packet? Why don't I have to simulate a voice exchange at the exams?

Of course, who could afford to be a ham if we had to prove all modes? Who would even be qualified to administer the test?

I think your last comment must be correct, because the 2.3 GHz EME guys (myself included) have gone to the IARU standard polarization. Since most of the EME activity has been on the 2.3 GHz band since about 1983 or so, I would imagine that the beacon has been off for at least that amount of time. Paul Wilson, W4HHK, who is credited with the first two-way off the moon on 2304 with Smitty W3GKP (sk) has never mentioned it in any of our many conversations regarding 2.3 GHz EME. We regularly listen on the band for various "beacons" including a couple of the Soviet COSMOS birds, so I feel sure if there were any chance of hearing it, or reactivating it readily, Paul would be working toward that end. After all, it's the only band he "regularly" operates!

It's an interesting subject, and I personally wish that those experiments were still operational up there, as they would provide a very constant weak-signal source to use for antenna/preamp performance measurements.

My $.02 on the subject.

Dave KD5RO

1911. Only an opinion....

Newsgroup: rec.ham-radio
Date: 1989-08-02 19:39:04 UTC
From: hcooper@esunix.UUCP
Message-ID: <1425@esunix.UUCP>
Source record: 17635

Disclaimer: the following is my opinion only, and not intended to show favorism or disfavorism toward any one person, group or organization.

After reading all the comments and arguments, I thought one more opinion wouldn't matter, so here it is:

First, I hold a technician class license, and hold a degree in electronic engineering. This by no means makes me an expert in amateur radio or electronics, just experianced in both. I have been involved in communications of one sort or another for the past 15 years. This started in shortwave and public service monitoring (including the 2M ham band). This then evolved to the ever loving CB. From the past comments, it seems that CB went to pot some years back, and never climbed back out. I have not had a 11 meter unit turned on for about 4 years in my area (I do have one somewhere in a box, I think), but a collegue of mine did just last weekend, and sure enough, it still is bad out here in happy valley (Salt Lake City). The funny thing is that he looked thru all 40 channels, and found everybody trying to talk on channel 19. But anyway, when I was involved in CB, I took pride in my equipment, and the fact that using a legal power output with good antenna combinations, I was able to talk at some great distances. Mind you, I may have been breaking the 150 mile limit (hmm, strange rule. Something like the Utah legeslature drafting a law to limit the level of the Great Salt Lake - harness nature, right?) but I never ran anything over 5 watts doing so. I did enjoy CB, but this was before the "great boom of the seventies". Once this started to occur, it became more frustrating than anything else. But I did get involved with ham radio.

The only reason it took me so long was the code. It frustrated me then and still does now, as I am trying to upgrade. I passed the written 100%, but missed the code by two lousy questions. Do I think we should abolish the code? Personally, no. This has nothing to do with the fact of earning our licences. I earned a engineering degree without taking a code test, but based upon theory. What does engineering have to do with operating a radio? In alot of cases, nothing. But you still have to know technical operating principles in either way. If you have a 100 watt amp on your 2M rig and still can't hit the repeater in the same town, then basic theory would point the way to fix the problem. I don't really believe that a no-code license would turn the ham bands into another CB type service. Remember, the FCC still enforces the rules here, while on CB - is there still a part 95 r&r? Another fact is that we are somewhat self policed, and that has kept it pretty good in most places. I believe we should retain the code because it still is a basic necessity for communcations.

For example, if a accident occurs, and a HF rig is availble, an amateur operator could call for help, even if the mic is broken. Don't tell me if you don't use code, you will forget it. I had not even listened to it for over a year, and could still copy 5 wpm. No, I am not the exceptional case, as in it took me over 8 years to get code beat!

One last comment for today. It really irritates me when people say that amateur radio is not contributing to the art. I don't know about you, but I can't think of any other convienient methods to transmit or modulate a signal. There are other ways no doubt, but our hobby has reached a point of refinement, rather than invention. Like someone else mentioned, we are learning new ways of implementing modules, more of a system/block design. HOWEVER, I dare you to find any large engineering company that is on the cutting edge of technology that does not have at least one ham there. We are contributing to the mass of technology. I wish that I could contribute more to the radio technolgy, but alas, my analog background is not as strong as I would want it to be. So here I sit, waiting for the flames to erupt around me. Oh, I still have some comments on no-code, pizza patches and the like, but enough for now.

From: mn@atari.UUCP
Message-ID: <1636@atari.UUCP>
Source record: 17639

I know you think Kenwood doesn't make antennas.Maybe they don't but the one
I'm going to describe is packaged with Kenwood Stereo amps.
It's an AM band loop antenna whch measures about 8" tall, 4" wide and
about 1/4" thick. A round plastic base with 4 screw holes lets you mount it
on a wall, or like me, keep it on top of the rig I used for AM band DXing,
an Icom R-70.
Last weekend I played around with it at nightime and logged about 20
out of state stations, some coming in surprisingly strong even taking into
consideration the distances nightime AM can travel.
What I like about the antenna is that one edge of the loop rectangle
can be turned so that it completely nulls out the station in that direction
while if you turn it 180 degrees it comes in. I'm a little new to indoor
loop antennas so forgive my very basic use of terms here. Even strong local
stations could be nulled out making it very suitable for direction finding.
Since it came packaged with the stereo amp Kenwood must have a pile of
them somewhere and while it's not a seperate product you might be able to
get one from them. I don't have the model or part number right here in front
of me but if anyone wants it I'll look it up when I get home.

From: collier@eagle.hf.intel.com.UUCP
Message-ID: <638@gandalf.littlei.UUCP>
Source record: 17647

Well, since there's a lot of mod' req's floating around, I thought I'd mention something I discovered while attempting to perform a clone data dump on the Yaesu FT-470.

The Yaesu Customer Service Rep' that I called today claimed that the FT-470 *does* have a cloning capability despite the lack of instructions in the manual. Supposedly, the way to get into Clone Mode is to turn on the radio with the F/M key depressed.

HOWEVER! If you turn on the radio with the RPT key depressed, the radio becomes a crossband repeater. Try it! Dial up two frequencies you want to crosslink (be sure to pay attention to transmit offsets, if any), turn the radio off, depress the RPT key, and turn it back on. The tone encode/decode flags and the -+ flags will be flashing. When either band's squelch opens, the other band is moved into the primary frequency display and the transmitter keys. Note that the power output is decreased to Low power. One note: the crossband audio isn't great, probably because it's whatever comes out the speaker and gets fed back into the mike. I suppose if you got serious, you could create a short interface cable to plug into the top of the radio.

And back to the data dump: I'm hoping to duplicate the efforts of another ham who posted on this network about his success in modifying the FT-411's dump. My problem was that I saw nothing coming out of the clone port when I hit the ^ key. Ideas?

73's & happy dual/crossbanding!

1924. FAX converter question

Newsgroup: rec.ham-radio
Date: 1989-08-03 09:06:42 UTC
From: bj@dc.luth.se
Message-ID: <831@puff.luth.se>
Source record: 17648

Hi All!

I have been looking at the different FAX converters available on the market. The PK232 sounds interesting, but the info I have seen on it says something like "The PK232 comes with a standard 'Y' cable and outputs FAX data to a parallell printer."

Does anyone know if it is possible to take the FAX output from the PK232 into the computer instead? I was thinking of saving the data to a file and then do some processing on it before sending to the printer.

Answers via mail please. Anyone having comments on the PK232 or any other FAX converter is also welcome with their info, if there is interest, I will summarize to this group.

Thanks,

Hi,

I have been reading the Mods for all the other radios on the market, but
no mention of any for the Yaesu FT212rh. Am I the only person with one
of these, I would be interested in any info.

CEO summary:
In reference to the Doppler DF from Dick Smith, I believe they're still in business "sort of". Apparently their US operation was bought out by someone in Michigan?
I've got three articles on Doppler DF at home, the references for which I'll post tomorrow, if I remember to write them down :-).
The police here are using a stolen car tracking system called Lo-Jack which uses a transmitter hidden in the car (about $600) activated by a broadcast signal. Seems like every town around Boston has a cruiser with the 4 VHF whips on the roof and a doppler DF display on the dash. Don't know whose manufacturing the DF gear but it seems to work...a friend heard them on the scanner one night & they drove right up to the car with the guys still in it! Doppler shouldn't be too expensive to build...I'd say parts cost is under $50 for the electronics, more if you try to vary the gain of the antennas linearly rather than just switch them. I'm gonna build one Real Soon Now!:-)

I guess this needs to repeated at certain intervals:

Amateurs must demonstrate CW proficiency to become licensed to transmit
below 30 MHz because THE UNITED STATES AND CANADA SIGNED AN INTERNATIONAL
TREATY TO THAT EFFECT.

CW isn't required for "tradition," for "elitism," for "keeping out the
riff-raff" or for any other reason other than the treaty.

Certainly a knowledge of rules and regs comes in handy when operating. And,
even for the appliance operators, a certain minimal technical level is
required, for example, to prevent them from melting their finals into a
high SWR, or to understand WHY some of the regs are as they are.

>We know the answer, of course. CW is, like most of the material we're tested
>on, yet another filter. More importantly, it's the *only* one you can't fake.

Apparrenty you mised the brouhaha over Wayne Green's "How to pass 5 wpm
without knowing the code" article in 73. Yes, you can fake it at 5 wpm.
I strongly suspect, however, that if the code requirement were eliminated
in favor of a "true" tech test, we'd be up to our ears in technogeeks, and
we could forget about getting nontechnical people into ham radio.

1929. Radar-absorbing paint

Newsgroup: rec.ham-radio
Date: 1989-08-03 17:43:02 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <158398@Wayne-MTS>
Source record: 17652

My information is that the coating used on SR-71s contains microscopic iron balls that both absorb radar and help the aircraft to radiate heat generated by atmosopheric drag (and the radar absorbtion).

A few years back Car & Driver built their own stealth car. Starting with a COrvette (of course!) they added thick conductive foam panels behind the glasswork, mostly in the front half. They were able to cut the radar signature to the point where they cut the range of their test radar to something like halk, or perhaps even less. Topping this off was the best fuzzbuster they could find.

One correspondant mentioned that most police radars use an IF right around 2m; I wonder if this might not be the best place to jam? Don't have to worry about X vs K vs whatever. How about 160 watts of F1, with a periodic "de WnXXX TEST" thown in...?

1930. Re: Repeater interties

Newsgroup: rec.ham-radio
Date: 1989-08-03 19:58:24 UTC
From: t-petesk@microsoft.UUCP
Message-ID: <7229@microsoft.UUCP>
Source record: 17653

I'll give a little information on the Evergreen Intertie in
Washington, Oregon, Idahoe, and British Columbia just to give everyone
an idea what we have here.

The system is basically made up with a number of trunks, each with
a number of repeaters. These trunks cover different areas, for example:
locally we are in the domain of the north-south, and the east-west trunks
in washington state. Some trunks contain 5 or 6 machines, and some
only contain 2 or 3. Each machine can be added or dropped from its
trunk using a DTMF Tone Pad command, and in addition, each machine can
be queried as to its status. Each repeater can also operate on a number
of bands, some operate on 2m, 220, and 440, and I believe some have
10m links also.

Trunks can be connected together using other DTMF Tones, so theoretically,
the whole system can be linked together at once. (If all the machines are
working). This major linkup only happens during large area nets and other
such events.

Normally, though, most machines are connected to their trunk only. This
gives a wide range of communication, but keeps the system from overloading.
If necessary, anyone can bring up another trunk\repeater if they need it.

This type of system gives 2m a new meaning. For now you can do "DX" with
a HT. Every Tuesday, one of the repeater groups does a phone patch
to a repeater somewhere else in the country, and in addition, all of the
Evergreen Intertie is brought up. This DX net can last for hours, but
it has given many VHF people a chance to get some far contacts.

So anyway, that gives a quick summary of the Evergreen Intertie system.

There have been so many requests for accessing these Ham Stacks on the net, that I would like to announce that it will soon be available on the net. I've had many people offer to put it on the net. Rather than have everyone put it on their own system and to provide a control (so that the LATEST version is always available...Novice Ham Stack is at version 1.3 right now), I've arbitrarily chosen the first person that offered, Peter B. Hayward.

Peter will be receiving the Ham Stacks soon and will make them available to anyone who requests them. He will email me instructions as to how people can access them shortly. At that time, I'll post news. Meanwhile, be patient, or ask for a diskette. Peter warns me that the files are VERY LARGE and can only be pulled over in chunks.

Thanks to all of the netlanders who also offered their services.

Sorry for the ire spent on my last posting - I hadn't had
my coffee...

Regarding the issue of ordering pizza via autopatch - I happen
to be reading the regs in order to obtain my technician's
license, and came across this blurb on page 7-7 of the "Thou
Shall Not..." section of _The FCC Rule Book_, ISBN 0-87259-002-X
regarding the (mis)use of autopatches:

"2) Phone patches or autopatches involving the buisness affairs
of any party must not be conducted AT ANY TIME.[Their emphasis]
The content of any patch should be such that it is clear to
any listener that buisness communication is NOT involved.
Particular caution must be observed in calling any buisness
telephone. Calls to place an order for a commercial product
[read pizza] must not be made, nor may calls be made to one's
office to receive or to leave buisness messages."

I'm not trying to point any fingers, I just want to let you know
that this issue seems to have already been addressed.

Flames ignored, intelligent discourse welcome.

Here's a question for all you legal-eagle types...

I noticed that the FCC rules for amateurs are Part 97. I think
maritime communications are covered under either part 80 or 87.
How many Parts are there to the FCC rules? To whom to they apply?
Where can one get a copy of them? (paper, floppy, 300Mb pack, etc.)

Thanks in advance to all who respond. :-)

>
>Also, why not make it lapse after a year/three years?
>And make it renewable only *ONCE* That would motivate them to upgrade!
>
> Pete G6WBJ

Do you suggest making in a requirement to display hands on experience
only if you worked for an *starter* no-code license. Please be serious
here. Explain how knowing the code automatically assures that you are
not an Appliance operator????

As to the code-free hams turning the bands into muck, I have yet to see
anyone from a country with code-free licenses complain. Stick to facts,
not supositions.

As to contributing to the hobby. *I* have contributed to amature radio
for 15 years and am not a ham (*YET*) for the inane reason of blowing the
code test many many times. (I have currently certifs. up to advanced for
theory) I can walk through the theory exams (up to general by osmosis with
hams etc..., no extra study) and I can copy at about 13 WPM at home, but freeze
on the code test by the VECs. As to my contributions, lest you disbelieve,
I have worked with (long ago when repeaters had call signs) WR4AID, built
much control hardware for various projects, contribute time and a warm body
for grunt work, currently am losing a great deal of many making packet
gadgets, and probably have loaned out more 1200MHz gear (that I can honestly
say I never operated except as third party traffic with an appropriate
control op) than most people ever see in one place (side note: 1200 MHz
really does work, and work well if you take care and understand the limitations)
<flame off>

I am in favor of the ARRL no-code proposal, but favor the original
that did not have the repeater restriction, zoo-meters is no great
loss for what I want to learn. I would also favor some *official*
recommendation that code be practiced by no-code license holders on
certain frequencies to allow them to be comfortable with the code. Also
I would appreciate a tiered license structure so that code free hams
code enjoy FSTV along with the hams *classic*. More recommendations

will follow (read about them in the federal register, I will comment on the proposal)

ARRL should put thier money were thier mouth is. Give non-hams interm voting privs. until the issue is resolved.

> a significant number of new hams to the existing roles.

I don't believe we have to let this happen.

> I also believe this. Most people believe that ham radio is "something they
> used to do a long time ago". My neighbor remarked that "he was surprised
> that people were still doing that".

I beg your pardon. Packet radio is definitely NOT "something they used to
do a long time ago". Ham radio is DIFFERENT TODAY. You neighbor, and the
people opposed to a codeless license, don't seen to know yet that ham radio
has changed. What they used to do a long time ago, they still do. However,
there is a LOT MORE to ham radio today.

We need to educate the neighbors about what ham radio is; but first we have
to understand it for ourselves.

> The truth is, in today's "immediate gratification" mind set, most people
> just don't find it very interesting. They'd probably rather be playing
> video games or watching TV. The only way we could attract them to the
> hobby is to cheapen it in order to give them some quick thrills.

It is not necessary to attract everyone. We also do not need to cheapen it
for quick thrills. We need to make some of the really great thrills
accessable to those who are not interested in every different thrill
ham radio has to offer. Don't force morse code down the throat of someone
who is not interested in it when there are plenty of things in ham radio
that do not need morse code.

> Next, if the code is eliminated, the complaint will probably be: "The
> written test is too difficult".

Did someone say "The Morse Code Test is too difficult"? Some probably did,
but that is NOT the reason for a codeless license. Most of us are saying
"The Morse Code Test is not applicable to most of the new things that Ham
Radio has become today".

> This argument is a parallel to one stating: "Why do I have to take
> English (or philosophy/art/history/.....) in school when I am an engineering
> major. I won't use it".

The comparison is defintely NOT parallel. Those subjects help you survive
in a cultural world. Morse Code is a skill that supplements your life only
in certain areas you may choose to do or not to do (and most people are
choosing not to do). You WON'T use English/philosophy/art/history if you

become a hermit; at least not much.

> Yup, just another hoop to jump through but it keeps out the unambitious.

It keeps out the ambitious as well.

> 'Same thing could be said with my job. Well heck, you don't REALLY need
> a degree to do the job, do you??

I don't have one.

> It's an indication that one put off immediate gratification and set one's
> sight on a long term goal and pursued it until it was obtained.
> 'A counter to the "I want it all and I want it now" way of thinking
> that is too prevalent in current times.

Why do you think that a codeless license class constitutes "...all...now"
way of thinking? BACK UP YOUR ARGUMENTS!

> There is a sense of validity to each side of the "no code argument" but
> the real problem is that people aren't as interested in talking over the
> radio as they used to be. 'Similar to the days when children longed
> to be locomotive engineers. Times have changed.

You, WE, haven't given them a chance. Each time some little spark of
interest starts to glow (see, its NOT dedication yet), what do we do?
We extinguish that spark with the Morse Code REQUIREMENT.

There may be a LOT of people interested in talking over the radio. They
have been turned off of ham radio for the silly inapplicable hazing that
we do. They have been turned off of CB for reasons I think we all know
(they a few learned the wrong things there as well).

What does seem to be true is that fewer people are interested in talking
over the radio in MORSE CODE. Some of those who had that spark extinguished
by the code requirement may well have developed a spark of interest in code
as well someday; but we never give them a chance.

> Maybe if we could transmit video games over the air at each other.... ;-)

Chess by radio is already being done. But I do think you are trying to poke
fun at a bunch of kids who have nothing else to do but waste their quarters
in a video game because we have put up stupid barriers to them doing something
much more entertaining, useful, and productive.

> etc.

Yes. I've noticed this. I am one of these people.

> Code may be hard to learn if your heart isn't in it..agree?

It may be, but "hard" is not the issue. "applicability" and "waste of time"
are the issues.

> Well, I personally don't forsee ever using SSTV for example
> so why did I have to study all that technical and regulatory
> stuff? Why not only test on things we like and intend to use?

In part I agree with you. First, hoever, you need to realize there is a
difference in learning enough about SSTV to answer 1 or 2 questions, and
learning how to fully copy (and send) in Morse Code.

I am all for having questions in the written exam asking about morse code.
I would want to see 1 to 3 questions in the exam (at its current size)
asking things ABOUT morse code.

> Sounds like the train of thought I keep hearing from the
> no-code advocates. Amateur radio gives us priviledges and
> responsibilities that I don't mind studying for... guess not
> everyone wants to be a part of the whole.

The "whole" has gotten quite large. We can't possibly test everyone on
everything in a fully comprehensive manner anymore. The Morse Code test
is the most comprehensive single subject on the whole exam.

> I have been licensed for 10 years. I work CW only, because I
> really enjoy it. I was a single mother with 3 kids (2 in diapers)
> when I got my first ticket, which was an effort for someone who
> had no idea what a "ham radio operator" was, let alone a diode.

I'm glad you are interested in CW.

> Why all the fuss about passing a few tests? People from 8 to 80+
> have done it so it can't be THAT bad.

When they are interested in Morse Code, one easily overlooks the fact that
Morse Code (one subject) constitutes half the whole exam process. Others
are so dedicated to becoming hams, they would do whatever anyone asks them
to do (and some of them might still be jerks and ruin 75m).

ICOM makes a board to covert from parrallel to serial for the older
ICOM equipment. Try AES or HRO (I can't remember the part number off
the top of my head) I believe it is about $25.00 at discount.

And I guess the response needs repeating just as often!

>Amateurs must demonstrate CW proficiency to become licensed to transmit
>below 30 MHz because THE UNITED STATES AND CANADA SIGNED AN INTERNATIONAL
>TREATY TO THAT EFFECT.

(a) NO ONE is talking about below 30 mhz so the treaty doesn't apply!

(b) "CW proficiency" has been defined by some countries as "knowledge of
the words Morse and Code together". Taiwan for instance has NEVER had a CW
test (post WW II) nor have they allowed CW transmissions!

So sue them.i

>CW isn't required for "tradition," for "elitism," for "keeping out the
>riff-raff" or for any other reason other than the treaty.

I agree here, since the treaty doesn't apply ...

SAY YES TO NO CODE!

Subj: PK-232 + C64 installation problem -- HELP!!
Can somebody help me with this one??????????

I have been trying to install a new PK-232 using a C-64 on packet for the first time
I seem to be able to receive and send OK on other modes (say AMTOR) without problems.

However when using PACKET,

I cannot get packets to print on the screen when in the MONITOR mode.
(it says MONITOR at the top of the screen) or anything to print.

I seem to be decoding packets OK because when I hit the F1 key it lists the packet stations heard. This means it is hearing without problem.

I am listening to HF stations around 14.103 MHz.

I have VHF OFF
HBAUD 300
MONITOR 4 (have tried up to level 6 with same results)
MTO ALL
MHEARD ON
MFROM ALL
PACLEN 128

Any ideas packet experts?

In article <127@ssc.UUCP> tad@ssc.UUCP (Tad Cook) writes:
>I think you will like the PRO2005. ...

Well, I have been thinking that a scanner would be fun to have, and then all those articles on spectrum analyzers/monitors came up (Ham radio, 73, QST, RF Design, and Radio-Electronics are the mags which have 'recently' (ha - within the last 10 years or so) had articles about spectrum analyzers and/or monitors.

It strikes me that using the squelch output of the decoder chip as a 'stop scan' signal would turn a spectrum monitor/analyzer into a pretty FAST scanner. (Scan the entire range about 100 or more times per second...) I would think you would have to scan only 'small' ranges of frequency, however. Otherwise you would probably not be able to distinguish between very close signals.

And, if you wanted to go berserk, you could design a computer control for your SA/M which would allow you to (1) digitize the SA/M output (for such uses as differencing different freq. displays with each other) (2) control the scan frequencies directly, thus allowing frequency hopping, priority channels, and scanning large freq. ranges and yet being able to 'slow down' in the area of a signal allowing you to distinguish close signals, and (4) tweaking of the ramp waveform so that you get a more linear and accurate frequency display. And I'm sure I missed a lot of other things. (I've been thinking that adding A/D, FFT, and D/A chips would allow you to watch the modulation of a signal without having to get extremely narrow filters (see below))

So, why have I 'wasted net bandwidth' with my crazy scheme?

Because I want to know just how insane this idea is, and to discourse with others who would like to benefit from a 'group' discussion of such things. So, what thinketh the net? Is this a totally hair-brained scheme, or do I have the makings of a good thing?

(Below: a note about the seemingly random comment made above about A/D, FFT, and D/A chips:
My thought was to digitize the non-scanning audio output of the SA/M and do a FFT on it, and then analog-ize (?) the resultant spectrum for the scope. (Yes, I am ignoring the fact that I *could* hook this thing up to my At compatible and display all this stuff on the screen, as I would rather not have to lug my AT around when I want to use a SA, thank you :-). The purpose of this A/D FFT D/A is to allow finer resolution than you can

get with the filters alone. If you had 3kHz wide filters, it
seems to me you should be able to get "relatively inexpensive"
A/D, FFT chips which would give you resolution down to the 3 to
6 Hz range. Is all this trouble worth it?)

Obviously, I've never used a SA/M nor a scanner :-).

x
AHOY! BOAT ANCHOR RESTORATION DEAD AHEAD

by Bob Parnass, AJ9S

I lost my self control at a hamfest early this summer. It happened when I broke my 11 year old resolution against buying equipment containing vacuum tubes. This was a promise I had to make myself in order to keep from buying literally tons of old transmitters, receivers, and test equipment that I could not afford as a teenager in the 1960s but which was now available for just a few dollars at summer hamfests.

Johnson Viking Invader 200 Transmitter

It took more than determination to carry 60 lbs of transmitter across a hot, dusty Santa Fe Speedway back to the car. It took a loyal ham wife and a helpful Bob Kenyon. Who could resist buying E. F. Johnson's last ham transmitter at such a good price?

When it comes to manufacturing ham equipment, E. F. Johnson was a class act. Johnson not only made the transmitters, but the knobs, connectors, insulators, and capacitors that went into them.

Introduced about 1962, the Invader 200 was Johnson's first filter type SSB/CW/AM transmitter. Back then, it sold for $620 and featured 200 watts, built in SSB VOX, and a rotating dial drum VFO. The power supply was on its own chassis, but built into the same cabinet as the RF deck, making the Invader a heavyweight. Since the VFO was the heterodyne type, it provided uniform band spread on each band, but tuned "backwards" on some.

A 2000 watt amplifier module and external high voltage power supply were available at one time to convert the Invader 200 to an Invader 2000. Unlike many of today's fixed tuned solid state radios, the Invader could match unbalanced load impedances of up to several hundred ohms.

My Invader looked in good physical shape, but would it "play?" After replacing a 12BY7A driver tube and one of the gassy 6146 final amplifier tubes, the venerable Invader played to the tune of 90 watts output.

Let me digress a moment to speak of vacuum tubes. Little did I imagine that I would be getting so much use from my B&K 747 tube tester (another hamfest purchase)! Have you ever bought a used tube at a hamfest from a seller who, while looking you straight in the eye, swore his tube worked? To put it politely, some sellers make mistakes. I went through a few 12BY7A "hamfest lemons." One old tube made the Invader chirp like a sparrow. Another could only drive the transmitter to 20 watts output. I bought peace of mind and a new driver tube for $6 from R&L Electronics.

Not having worked on a tube transmitter since the 1970s, I forgot that driver tubes can require neutralization, i.e., adjusting an external capacitor to compensate for the tube's internal capacitance. My new 12BY7A was no exception -- the Viking would "take off" by itself and transmit around 40 meters even while switched to Standby!

When restoring an old transmitter or receiver, it's good to swap advice and parts with a friend, like AK9L, who enjoys the same pursuit. Bob Jackson does for a hobby what Sanford and Son did for a living, although he intends to transform his basement from a radio graveyard to a radio museum. Luckily for me, Bob's collection includes an Invader 200. He gave me a copy of the instruction manual, and Ken Olson at E. F. Johnson was nice enough to mail me a schematic.

After comparing my Invader to the pictures in the manual, it became obvious that a bottom RF deck cover and final amplifier cage were missing. I wouldn't need these covers to transmit, but they were supposed to prevent TVI and electrical shocks. AK9L lent me the cage from his Invader, so I could copy its dimensions and make up sheet metal drawings. Using perforated sheet aluminum from the local hardware store, I fabricated a cage and a bottom cover.

I've had several CW QSOs using the Invader, and it now serves as my main HF transmitter.

Did I renew my promise to boycott tube equipment? Not a chance! The Invader was just the start.

Heath HX-11 Transmitter

"Aw, just gimme a couple of bucks," was what the soft spoken man said when I asked him how much he wanted for the Heathkit HX-11 transmitter. He accepted my counter offer of one dollar, and I walked away with the HX-11.

The Heathkit HX-11 transmitter appeared on the market in 1961 as a replacement for the DX-20. It is one of

several transmitters targeted for budget conscious novice operators. Back in the "old days," novices were limited to running 75 watts input on cw, and restricted to using crystal control.

The HX-11 pi network output is capable of matching loads up to 600 ohms. As in the DX-60 series, the HX-11 contains a built in low pass filter to suppress harmonics which may cause television interference.

The circuitry is simple, consisting of a 6CL6 crystal oscillator and a 6DQ6 final amplifier. The HX-11 was designed before silicon diodes were popular, so it uses a 5U4GB rectifier tube instead. With a good set of the tubes, the rig produces about 30 watts RF output.

My HX-11 was clean and free of rust, but required some restoration:

1. Replaced missing 6CL6 driver tube with one from an old Motorola D33CMT business radio someone gave away free at the Dayton HamventionO.
2. Replaced the frayed 2 wire AC line cord with a 3 wire cord from my junk box. I used a rubber grommet in place of the plastic Heyco chassis bushing.
3. Replaced the DPDT meter slide switch with one from a Motorola Alert Monitor receiver.
4. Replaced a broken crystal socket with a surplus socket furnished by AK9L.
5. Added a capacitor across the meter terminals to provide a damping action. Before this, the needle would flail wildly all over the scale when the transmitter was keyed.
6. The rubber feet were missing from the bottom of the cabinet so I installed 4 rubber feet, purchased for 50 cents from a hamfest.

The HX-11 lacks features we take for granted nowadays, like a sidetone generator and an antenna relay. I use separate transmitting and receiving antennas, otherwise I would have to install a relay to switch an antenna between the HX-11 and my station receiver.

HallicraftersO SX-140 Receiver

It couldn't have been due to its stellar performance, so it must have been nostalgia which possessed me to buy a Hallicrafters SX-140 and its companion HT-40 transmitter at the hamfest in Peotone. As a Novice back in 1965, I used a 5 tube Hallicrafters SX-140 receiver. The SX-140 was a simple 80-6 meter ham band only radio with a single selectivity setting - WIDE.

Upon examining the receiver, it became clear that this radio hadn't been used recently. The outside was dirty and there must have been several ounces of dust inside.

Would application of 117 VAC bring this thing to life, or fill the basement with smoke? I connected a speaker, antenna, and power, and turned the set on. The dial lamps lit, and after a short warmup, the dirty SX-140 pulled in several signals, but all the CW notes warbled horribly. Moreover, the receiver was completely dead on 15 meters.

A thorough cleaning both inside and outside was followed by an application of contact cleaner spray on all rotary switch wafers and inside potentiometers. I used a small drop of household oil to lubricate the control shafts where they went through panel bushings.

I reassembled the chassis back inside the cabinet and reconnected the SX-140 back into my station. This time, the receiver behaved much better. Signals were now stable and 15 meters came back to life! Dirt on the bandswitch had apparently been the cause of the earlier trouble.

Prescription for Restoring
Boat Anchors

Before connecting any old radio to voltage, inspect the AC line cord for cuts and abrasions. If it's not safe, replace it. I'm not a fanatic about exact restoration so I don't insist on using only an "original equipment" part. Most old radios used 2 wire line cords, and I never hesitate to replace an old 2 wire cord with a modern 3 wire line cord.

If the radio has been dormant for a long time, the electrolytic capacitors may need to be reformed. I plug the radio into a VariacTM autotransformer and start out running the rig from 20 volts AC or so. Over the next 24 hours, I gradually increase the line voltage every few hours, up to 117 volts.

I have found that the easiest and most effective way to clean equipment knobs is by using an ultrasonic cleaner filled with water and liquid dish detergent. This method excels in vibrating the dirt free from the crevices of fluted or engraved knobs. Why bother with using toothpicks or toothbrushes to clean knobs? Let the ultrasonic do the work! Ultrasonic cleaners are useful for cleaning everything from dentures to jewelry and coins, and are available for as little as $10 from Service Merchandise.

A sponge and an old toothbrush, wet with soapy water, are good for cleaning cabinets and front panels. If a panel is really dirty or greasy, or stained with nicotene, use FantasticO liquid cleaner. After the exterior surface is clean and dry, apply a small amount of Armor AllO which leaves a shine on both plastic and painted parts alike.

Why would anyone want a "boat anchor?" This cannot be explained purely with logic -- it is motivated by the heart and not the head. Unlike classic cars or old Lionel trains, one can usually buy older ham rigs at a small fraction of their original selling price.

Many of us could not afford these rigs back when they were popular. Thirty years later, we are still trying to build our childhood dream station.

Bob,
I'm sorry to hear that the column will cease. Thanks for your efforts
in promoting it and the subject. With all the recent talk of amateur
radio's future, code/no-code and so on, the one point I thought seemed
to be emerging was that we need to provide an interesting enough hobby to
entice future (and present) hams into greater participation.
I personally feel that some kind of "New Frontier" whether it be
microwave or computer technologies is absolutely necessary if we are
to maintain a hobby of interest. My own efforts to combine these two topics as
will be seen in some future magazine articles (notably *not* QST) and
conference and convention papers.
Perhaps it is time for some grass roots prodding from some of us in
this readership to get the ARRL to wake up. Would anyone else be interested
in a nationwide high speed digital network supporting file transfer,
e-mail, news-groups, voice mail, database servers etc???? I certainly
would like to see even a small fraction of the emerging computer science
talent in this country get interested. Wouldn't they be interested
if there was an "alternate Internet" available which was, BTW, on amateur
radio?

160 Meters - 10,368 MHz AM/FM/SSB/CW

very 73,

---Tom Adams----

Well, Tom,

You got me looking through the archives for this one. I found the information on Page V27 in the 1969 ARRL Handbook. Here it is:

It's a Triode transmitting tube.

Plate dissipation: 100 watts
Plate voltage (max) 3000 volts
Frequency (max) 150 Mhz.
Amplification factor (max): 15.5
Cathode volts: 5.0
Cathode Amps: 10.4
Input Capacitance: 2.7 pF
Cap (g-p): 2.3 pF
Cout: .35 pF
Class of service: Class C telegraph, Class B push pull A.F. modulator (2 tubes)

Typicals:
(CW ratings)

Plate voltage: 2000 volts
Grid voltage: -340 volts
Plate current: 2110 ma

DC grid current: 67 ma
Approx driving power: 25 watts
Approx output power: 315 watts

The two top pins are the plate
the two side pins are the grid
the two bottom pins are the filament

There was no filament voltage rating in the book.

Now, you have my curiosity again...

What are you gonna use it for???

I have developed a color SSTV program for the Atari ST computer.
It has the most popular "Robot" modes. Now I would like to add
others such as Martin's mode, Scottie, and AVT but have been unable
to obtain any specifications.

I've asked people on the air and wrote a bunch of letters but no
useful information resulted. Can anyone provide me with detailed
information on these SSTV formats or will I have to reverse engineer
some actual signals?

Thanks.

John Langner, WB2OSZ
mit-eddie!polygen!john

P.S. For a copy of the program send me a blank disk and SASE or a few $
to cover the cost of disk, padded envelope and postage.

:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2053--July 25, 1989 ::
::::::::::::::::::::::::::::::::::

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Lars Ryden.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2053

-------------------------------------------------------------------------------

COMPUTER CORNER--We recently reported how Inter-Net connects to the FIDO-Net
system of computer bulletin boards. Now Ralph Brandi tells us about a brand
new interface between Inter-Net and CompuServe, the huge American-based
online information system. If you're on Inter-Net and want to send a message
to our CompuServe mailbox from a machine that understands domain-style
addressing, here's the address to use:

70247.3516@compuserve.com

CompuServe, which has more than a half million subscribers, recently bought
out its competitor, the Source. Which means the system should expand even
more.

TELEVISION--Recently viewers around the world could watch the Mike Tyson-Carl
Williams boxing match on closed circuit TV. The heavy weight championship was
transmmitted by satellite from Atlantic City, New Jersey around the world, to
special auditoriums where people paid high prices for the pleasure of
watching the fight.

Only early risers here in Sweden could also see the match, quite
unintentionally, on Swedish Television's channel 2. The video company that
bought the rights here hired Swedish Telecom to take down the satellite
signals and distribute the coded broadcast to various auditoriums around the
country. What Telecom did to distribute the signals was use Swedish TV2,
which was off the air at the time.
```

The signals were coded, but viewers who happened to be awake and turned on their sets saw the Tyson-Williams fight, although the picture was somewhat shakey and there was no sound. ("Dagens Nyheter")

COSTA RICA--Reports in recent DX bulletins indicate that the 60 meter band outlet of Radio Impacto sometimes can be heard on 5044 kHz instead of 5030 kHz, possibly to avoid interference. Reception on 5044 kHz has been reported right after midnight and after 04:00 from around the 10th of June as well as July 1st. At other times in the middle of June, Radio Impacto was reported back on 5030 kHz. The 49 meter band outlet on 6150 kHz is in parallel all the time. ("Onda Corta", Argentina; DSWCI "Shortwave News"; and "FRENDX")

CHAD--Here is the current schedule for French from La Radiodiffusion Nationale Tchadienne (RNT): 04:25-06:00 and 18:30-22:00 on 4904.5 kHz and 13:00-14:00 on 7120 kHz. According to the technical director of RNT the station does verify reception reports, but you have to enclose two International Reply Coupons to cover the cost for reply postage. (Awada Ehemir Torna, Chad)

HUNGARY--Last week we reported on the inauguration of the first commercial TV station in Hungary. Now there is also a commercial radio station, Radio Bridge, which started tests on July 11 on VHF 102.1 MHz. From August regular programs in English will be on the air for 12 hours daily with a format of news, music and travel information. (Ludomir Stejskal, Czechoslovakia)

INDIA--Broadcast media seem to play a prominant role in the current Tamil conflict in northern Sri Lanka. In recent DX bulletins we have reported about relays of Indian TV broadcasts in Jaffna in northern Sri Lanka as well as stepped up broadcasting in Tamil from the Sri Lankan radio. Adding to this picture, a 10 KW transmitter has been set up in Pondicherry in southern India which carries Tamil programmes to the Indian Peace Keeping Forces in Sri Lanka on 1449 kHz medium wave. The programs are produced in Madras. (Southern Asia Radio Club bulletin, India)

IRAQ--Here is the current schedule of Radio Baghdad in English: to Europe 20:00-22:00 hrs on 13660 kHz, to North and South America 01:30-03:30 on 11945 kHz and to India and Pakistan 01:30-03:30 hrs on 11810 kHz. (Salil Kr. Paul, India and Uwe Gruner, West Germany)

IRELAND--It seems as if Century, the long delayed new national radio service from Ireland, will not now go on the air until September. The original launch date was July 4. Now Century is expected to go on the air on September 5. Capital Radio, another of the new legal stations in Ireland, was expected to start broadcasts on July 20th. Capital Radio broadcasts from Dublin on VHF 104.4 MHz. (Edward Dunne and Barry Hennessy, both Ireland)

JAMAICA--With the return of Michael Manley as prime minister, Jamaica has made a complete turn around in its broadcasting policy. The privatization plans launched by the previous right wing government have been partly revised. Last year the former government awarded several radio licences for national as well as regional services. It has now been decided that the state-owned Jamaica Broadcasting Corporation should be retained for a national TV and radio services. The sale of the three regional stations, to

operate on the FM band, will proceeed. (BBC Monitoring)

MACAO--Radio Macao is to start shortwave broadcats in 1992 for all Portuguese communities in Asia, according to a Portuguese radio report. Teledifusao do Macau, which operates one of the two radio stations in the territory, plans to operate a Portuguese language radio station in Macao that would continue to broadcast on shortwave to all of the Far East after 1999 when Macao reverts to Chinese sovereignty. (BBC Monitoring)

PARAGUAY--Following the recent change of government in Paraguay many broadcasters have returned to the air, including shortwave. A few weeks ago we mentioned that Radio Encarnacion is again active on 11945 kHz. Now Emisoras Paraguay, Ascuncion, has reactivated its transmitter on 6015 kHz, heard around 10:00. ("Onda Corta")

SPAIN--The central Spanish and the Basque governments have now signed an agreement legalising the broadcasts of the second channel of Basque television and mediumwave radio broadcasts. This presumably refers to the broadcasts by Euskadi Irratia, Radio Euskadi, via a 50 kW transmitter on 1296 kHz. These broadcasts were reported in SCDX-2016, but the transmitter has been off the air for some months. (BBC Monitoring)

SRI LANKA--Since mid-June, the Hindi Service of the Sri Lanka Broadcasting Corporation uses an additional transmitter of 100 kW from 13:00 to 15:00 on 11895 kHz and from 15:00 to 16:30 on 11930 kHz. 11800 and 7190 kHz remains in parallel. This new transmitter was previously used by Trans World Radio. (Sourabh Bhattachrya, India)

SUDAN--Following the military takeover in Khartoum on June 30th, the army-run station on 9435 kHz, which previously identified itself as National Unity Radio from Khartoum, now relays the general domestic service of Radio Omdurman in parallel with 1296 kHz. The 9435 kHz outlet has been observed as early as 04:20 and as late as 21:00 hrs. (BBC Monitoring)

USA--The Voice of America Pacific satellite service has been observed on 9525 kHz at the unschedule time of 11:00-12:00 hrs. (Suresh Kumar Tumatt, India) Presumably this is a relay broadcast from a Pacific site. (DX Editor)

USSR--After many years of silence, the shortwave transmitter of Bashkir Radio, callsign RV 147, has been reactivated and can now be heard on 4030 kHz from 05:00 and 19:00, relaying Bashkir Radio's mediumwave program. Bashkir Radio is located in Ufa, capital of the autonomous republic of Bashkiriya. The target for the shortwave broadcasts includes not only residents of Bashkiriya but also those far away in the Far East and even DCanada where there are emigres from Bashkiriya. (Moscow Radio via BBC Monitoring)

ZAIRE--In recent years, many regional radio stations in Zaire have been operating rather irregularly. The following stations are currently repored active: Lubumbashi on 7205 kHz, noted signing on at 03:55. Mbuji-Mayi on 7295 kHz observed from 04:00. And Bukavu which can be heard on a frequency varying between 4860 and 4862 kHz, from 03:30 to 06:00 and again from 15:00 to 18.30. (BBC Monitoring) The Bukavu station has been widely reported by DXers in recent months. We have also noted that verification letters have been

received from Box 475 in Bukavu. (DX Editor)

UNOFFICIAL RADIO--There are two different stations broadcasting programs in opposition to the present regime in Libya on the frequency of 11825 kHz. One is The Voice of the People, the Voice of the Libyan National Movement, using the frequency at 11:00, 14:00 and at 18:00 hrs. There is also a special transmission on Fridays at 08:00. The other station is The National Toiling for the Redemption of Libya, on 11825 kHz at 06:00, 15:00 and 20:00 hrs. Both stations are very strong in N'Djamena, so it can be assumed that they are located in a country close to Chad. (Awada Ehemir Torna)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
03:00 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

15:30 hrs on 21675 kHz (East Africa)
17:00 hrs on 1179, 6065, and 9615 kHz
21:00 hrs on 1179, 9655 and 11705 kHz

And to Asia and the Pacific:

12:30 hrs on 17705 and 21610 kHz
14:00 hrs on 17705 and 21610 kHz
01:00 hrs on 15390 and 17790 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:202/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 54 contributors this week Good Listening!

RTTY DX NOTES FOR WEEK ENDING 4TH AUGUST 1989
Part 1 of 2
BID: $RTDX0408

SOME THOUGHTS FOR CONSIDERATION. JUST LATELY THERE HAS APPEARED SOME KIND
OF COMPETITION AMONG THE DXPEDITION FRATERNITY TO FIND OUT WHO IS GOING TO
WHICH RARE DX COUNTRY AND WHEN. THEN THERE IS A VALIANT EFFORT TO BEAT
EVERYONE ELSE TO GO THERE, MAKING SURE THAT THEY DONT TELL ANYONE (UNTIL
THE LAST MOMENT) THAT THEY WILL BE GOING TO THIS RARE COUNTRY. THIS TENDS
TO LEAVE A NASTY TASTE IN SOME PEOPLES MOUTH, ESPECIALLY THOSE WHO THOUGHT
OF THE IDEA FIRST AND INFORMED THE WHOLE WORLD THAT THEY WOULD BE GOING
THERE IN A FEW MONTHS TIME. WOULD IT NOT BE BETTER IF THE TEAMS GOT
TOGETHER AND MADE A COMBINED EFFORT? SO MANY MORE OPERATORS, SO MUCH MORE
GEAR, SO MUCH CHEAPER FOR ALL, AND SO MANY MORE SMILING FACES. WHAT CREDIT
DO YOU RECEIVE BEING FIRST TO A RARE PLACE IF YOU MAKE ENEMIES ALL OVER THE
WORLD? THINK ABOUT IT.

OUR THANKS THIS WEEK GO TO TG9VT, OD5NG, G0ABI, VK2EG, OH2LU, VE3JPC,
VU2SJV, I5FLN, G4TYI AND JA5TX.

BANDPASS.

1953. Re: Passing of New_Frontiers

Newsgroup: rec.ham-radio
Date: 1989-08-04 17:27:59 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <8908041727.AA11372@cmr.ncsl.nist.gov>
Source record: 17669

I, too, am sad to see "New Frontiers" disappear. My comments on no-code
to my ARRL director strongly urged increased QST emphasis on the microwave
bands. It also commented that hiding the microwave info in QEX would work
against increasing the (needed) activity on these bands. I sent the
comments to Paul Rinaldo (editor of QST) as well. Fine good it did!

As well as joining up with the N Tex Microwave Soc, I recommend urging
the Central States VHF Society (KO0Y new pres) to take a hand in this matter.
It is very unfortunate that Bob's announcement of the end of "New Frontiers"
came just AFTER the CSVHFS's annual conference. The attendees would
have been very angry if they had known about it - and would doubtless
fired off an "official" letter of complaint.

Also write Tom Kirby, W1EJ, head of the ARRL VHF UHF Advisory Committee
(VUAC). While his Committee seems to be largely ignored in Newington, at
least it would be appropriate for them to complain. Also contact your
local VUAC member (can't remember which QST has the names each year).

Your ARRL director (address in every QST) should know of your feelings.

It was good to see KD5RO, W9IP (and others?) from this group at the CSVHFS
conference last weekend.

Bob, W3OTC

My employer has no interest nor opinions in this matter....

1954. QST MIcrowaves "New Frontier"

Newsgroup: rec.ham-radio
Date: 1989-08-04 17:41:21 UTC
From: rma@mhgki.att.com
Message-ID: <2397@cbnewsm.ATT.COM>
Source record: 17530

Thanks to those who have emailed messages re: the dropping of the "New Frontier" column by QST. I may have a vested interest in the subject, but I think that a regular coverage of microwaves in QST is esential for continued growth in activity. Occasional feature articles are all very well, but they do not provide a focus, or common point, to which those interested in microwave experimentation can gravitate. Who does a newcommer to the bands write to for advice? Where do short technical items get published? What about the new "no-coders" who will, sooner or later and like it or not, be joining us on the bands above 220 MHz. We need to tell them about the 99% of all amateur spectrum allocations that exist above 1 GHz.

I realize that microwave activity is a very specialized part of amateur radio as a whole, but I believe it is a valuable part. Many of the technical advances being made in radio are occuring in the microwave field. Most of the future amateur satellites will use microwave up and/or downlinks. If you want to use very high speed data links the place to do it is on the microwave bands.

If you think that QST should have a regular microwave column, then let them know. Silence implies consent. If they don't hear from you they will assume you agree with their actions. If you want to e-mail a message to me I will be sure to pass it on. Get your friends on the microwave bands to let their views be known too. If its not worth 25 cents to register your opinion then I guess you don't want a microwave column (which is a legitimate viewpoint too).

I doubt that I could continue to edit any future microwave column. It seems like a conflict of interest for me to lobby for the column and continue to write it. I am sure that a new editor can be found who can do a better job than I did. If we can get commitment to a column we can cross that bridge when we come to it.

>
It may not be that kids are not fascinated with radio propagation anymore,
but they may just not be getting exposure to it.

>I know all about antenna restrictions, enthusiasm for computer
>hacking, the stagnant image of hams, etc. But I can't believe
>there aren't thousands of kids who twiddle the dials of radios and
>TVs every day in search of some distant station they've never
>heard before. And they should be hams!
>
I don't know about what it's like where you are, but here in CA, all the
new housing developements (the places you find the highest concentrations
of youngsters generaly) have severe restricions on antennas. The net result
is that cable is the only source to feed the TV. If the cable box is ever
disconnected, it is only long enough to get the Nintendo computer game
connected to the TV.

Back when we were kids, there was a lot more inventiveness. Now, all kids
get are 30 minute commercials for Transformers, HeMan, and The Teenage
Mutant Ninja Turtles (<-- This is for real! Listen and watch some grade
school kids, it's a real eye opener.). Kid's roll models aren't calling
CQ to the far side of the Earth with CW, they are blasting off in
rockets or flying in jets to it.

I don't know what the trick will be to get kids interested in Ham radio, but
whatever it is, we aren't doing it now! We better figure it out quick.

1956. Help needed with TS-820

Newsgroup: rec.ham-radio
Date: 1989-08-04 18:58:22 UTC
From: 702WFG@SCRVMSYS.BITNET
Message-ID: <8908050704.AA09463@ucbvax.Berkeley.EDU>
Source record: 17671

I am having a small problem with a TS-820 and am looking for anyone else who may have had the same problem and figured out how to solve it.

The digital display on my TS-820 has gone completely crazy. It seems to run free like it can't find anything to lock up on. It started out being only on the high end of 10 meters but has gradually moved down til it was all of 10 meters and then after a long rest (I was moving) I plugged the rig in and found it is now on all the bands.

Has anyone else seen this behaviour and if so what can I do to try and rectify it. The radio is still usable but now you have to use the ANALOG dial.

Any help please??

Howdy, Y'all!

One of the guys attending my code class last night asked about VLF. He had seen an article on the news-stand in Radio Electronics or some similar magazine, and wanted to know more. I didn't know more so I promised to find out.

This being a virtually bottomless resource of good :-) information, I thought I'd throw out the question.

What are the regulations regarding VLF operation?

We discussed it and came up with bits and pieces.

Unlicensed operation
1-watt power limit
50-ft <or is that 50-meter?> antenna length (?!?) limit
CW only

Can anybody out there quote regulations (preferably point me to what FCC Rules & Regs paragraph or Edict or whatever) regarding 1750-meters?

Any good articles? (I'm going looking for the one David referred to!)

Any war stories?

Thanks for any input...

> TREATY TO THAT EFFECT.
>
> CW isn't required for "tradition," for "elitism," for "keeping out the
> riff-raff" or for any other reason other than the treaty.
>
> Chuck Bowden, WB7R, chuckb@tc.fluke.COM

I guess this ALSO needs to be repeated at certain intervals so that those who can't connect the logic might understand:

There is NO INTERNATIONAL requirement whatsoever making it necessary for Amateurs to demonstrate CW proficiency to become licensed to transmit ABOVE 30 Mhz other than for the fact that it remains so in the FCC rules.

If it had been proposed to delete the CW requirement for getting privileges below 30 Mhz, then everyone would be using the "international" argument. Most hams now know it does not apply above 30 Mhz, so they have to use some like "keeps out the riff-raff" (which doesn't seem to work anyway), "It's a tradition in ham radio", "It ensures only dedicated people will enter the hobby", "It's easy to learn code" (which contradicts the "riff-raff" and "dedication" arguments).

> Also, why not make it lapse after a year/three years?
> And make it renewable only *ONCE* That would motivate them to upgrade!
>
> Pete G6WBJ

Why is it necessary to upgrade?

Upgrade from Communicator to what?

Technician? Why is there still a code requirement for technician (per the ARRL proposal)?

The ARRL proposal simply does NOT have an upgrade path for Communicator class licenses held by people not interested in upgrading to HF privileges.

Why is it that so many hams think that everyone has to upgrade to General through Extra and get on HF?

--Phil howard-- <phil@ux1.cso.uiuc.edu>

1960. Re: A few more no-code thoughts

Newsgroup: rec.ham-radio
Date: 1989-08-04 21:00:00 UTC

> forth, how about an entry level license consisting of Novice VHF and UHF
> privaleges? Pass the novice test w/o code, and you're a "Tyro" or
> "Communicator" or what have you. Try it out for a few years. If it works,
> we'll have lots of upgrades and new 1240 equipment on the market. If not,
> well, at least we won't have lost it all.

Those privileges aren't workable in other than major metroplitan areas, and
even then, are too limited.

Upgrading is *NOT* the goal. Why do so many of you code-addicts think
that the all hams have to upgrade? The people we are trying to reach
with a REAL codeless license class are the ones NOT interested in what's
going on below 30 Mhz.

Sorry dude, but that isn't an FCC ruling. If you read the fine print, you'll find that that little piece of regulatory wisdom was written by the ARRL, and not our illustrious fools in Washington. That policy was formulated in the 1960's, when it was illegal to connect anything to a phone line except Western gawdawful Electric equipment, and way before the breakup of the Bell monopoly. So you see, at the time, we had a neat thing going, and the ARRL had to be about as careful as Caesar's wife. Times have changed.

SpaceNews

MONDAY AUGUST 7, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* STS-28 LAUNCH TOMORROW! *

LAUNCH DATE SET FOR STS-28

August 8, 1989 has been set as the launch day for STS-28 "Columbia". The launch period for this Department of Defense dedicated mission will be from 7:30 to 11:30 AM Eastern Time (1130-1530 UTC).

* RS-14 DETAILS *

At the recent DATASPACE '89 meeting, UA3CR announced details of the RS-14 spacecraft, due for launch in "mid 1990". RS-14 will be launched as a secondary payload with a geological spacecraft. The planned orbit will be circular with a mean altitude of 1000 km and an orbital inclination of 83 degrees. The transponders will be Mode B. The analog transponder will be inverting with an uplink passband of 435.080 to 435.180 MHz and a downlink passband of 145.850 to 145.950 MHz. Beacons will be on 145.850 and 145.990 MHz.

AMSAT-DL took the opportunity of the Colloquium to finalize arrangements to fly RUDAK-2 inside the RS-14 package. Uplink will have two channels: 435.100 MHz (1200 bps) and 435.150 MHz (4800 bps), FSK. The single downlink channel will be 145.990 MHz, 1200 bps, PSK (FO-12 compatible). Different SSIDs will be used for telemetry, mailbox, ROBOT, etc. The Mailbox will have 512K of memory. Other details are the similar to those for RUDAK-1.

* VOYAGER-2 NEWS *

Voyager Status Report : August 2, 1989

Images from the Voyager 2 spacecraft have revealed three additional moons in orbit around Neptune. The discovery brings the total number of moons to six, including 1989 N1, discovered by Voyager 2 last month. Finding so many moons when the spacecraft was more than 22 million miles away from Neptune may mean there are many more to be found in coming weeks.

The three newest Neptunian satellites, temporarily designated 1989 N2, 1989 N3 and 1989 N4, were tracked as candidate moons in images returned by the spacecraft over a five day period. When the objects were found to follow predicted orbits, Voyager imaging scientists were able to confirm them as moons of Neptune.

All three new moons exist in the region where partial Neptunian rings, or "ring arcs," are thought to exist. If ring arcs exist, the new moons might play an important role in "shepherding" and maintaining them.

Some Voyager figures as of 02Aug89:

DISTANCE TO EARTH: 2,708,706,000 miles
DISTANCE TO NEPTUNE: 19,416,000 miles
HELIOCENTRIC VELOCITY: 42,187 mph

Voyager will come within 3000 miles of Neptune on 24Aug89 at midnight EDT.

* OSCAR-9 NEWS *

The current operating schedule for OSCAR-9 indicates that Diary software reloads will take place on Tuesdays, UTC. Digitalker telemetry will follow. The telemetry channels currently being downlinked by the Digitalker include:

08 : Battery Pack A Temperature (C)
18 : Battery Pack B Temperature (C)
22 : Battery Voltage +14V (Volts)
29 : Spacecraft -Y Facet Temperature (C)
35 : 145 MHz Beacon Output Power (UnCalibrateD)
39 : Spacecraft +Y Facet Temperature (C)
49 : Spacecraft +Z Facet Temperature (C)
59 : Spacecraft -Z Facet Temperature (C)

Note that the telemetry value for channel 35 is UnCalibrateD (UCD).
In order to decode the proper value for this channel, substitute the "N" value given by the spacecraft into the equation : (N-82) * 1.67. The result is given in milliwatts.

* OSCAR-13 RUDAK *

Remember RUDAK? A final attempt to resurrect this AO-13 experiment will be made in December when spacecraft temperatures will be higher (plus a little help from attitude and switching adjacent equipment on).

* LUNAR ECLIPSE *

A total eclipse of the moon will occur from August 16 to 17. The beginning of the umbral phase will be visible in Europe, the Middle East, Antarctica, the Atlantic Ocean, South and Central America, eastern half of North America, and the eastern half of the south Pacific Ocean. The end will be visible in West Africa, Western Europe, Antarctica, the Atlantic Ocean, South, Central and North America (except Alaska and the eastern half of the Pacific Ocean).

The moon will enter penumbra at 8:23 PM EDT (0023 UTC 17Aug). Mid-eclipse will occur at 10:08 PM EDT (0208 UTC). The moon will leave penumbra at 12:53 AM (0453 UTC). The magnitude of this eclipse will be 1.604.

I've been looking for a used speed radar unit such as is used by police departments. I have found a couple of sources, but they are all over-priced. If you have one you are interested in selling or know of a source (e.g. State surplus liquidators), please let me know. Thanks.

**** UoSAT-OSCAR-11 BULLETIN - 195B 04 August 1989 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** DATASPACE '89 REPORT ** (compiled by G3RWL & G3YJO)

DATASPACE-89, held last weekend at the University of Surrey (UK), was very well supported and full of fascinating information. Over 200 attended during the five days with many foreign visitors and radio amateurs representing 20 countries from four continents. Major papers presented at the meeting have been compiled into a Proceedings - available from AMSAT-UK.

UA3CR took the opportunity to announce the forthcoming launch of RS-14. Once again this will be a piggy-back payload on a satellite; this time a geological mission. Launch will be in "mid 1990" into a 1000km, 83 degree orbit. The transponders will be Mode B - with an analogue (inverting) transponder with an uplink frequency passband of 435.080 to 435.180 MHz and downlink of 145.850 to 145.950 MHz. Beacons on 145.850 and 145.990 MHz.

AMSAT-DL took the opportunity of the Colloquium to finalise arrangements to fly RUDAK-2 inside the RS-14 package. Uplink will have two channels: 435.100 MHz (1200 bps) and 435.150 MHz (4800 bps), PSK. The single downlink channel will be 145.990 MHz 1200 bps, PSK (FO-12 compatible). Different SSIDs will be used for telemetry, mailbox, ROBOT, etc; the Mailbox will have 512K of

memory. Other details are the same as for RUDAK-1.

S Suri (VU2MY) spoke of plans for Indian amateur radio satellites.

Max White (of the Royal Greenwich Observatory) praised the work of GM4IHJ in tracking down one of the "Mystery Sats" that are currently emitting on about 435.974 MHz; it is the Polar Bear (USAF) satellite. There is still another one that has yet to be identified.

The Amsat-UK AGM had few surprises and most of the committee were re-elected. A brief discussion took place about corresponding members of Amsat UK. (Committee members would not be limited to those resident in Britain).

** AO-13 **

Remember RUDAK? A final attempt to resurrect this experiment will be made about December when spacecraft temperatures will be higher (plus a little help from attitude and switching adjacent equipment on). Fingers crossed - still there is always RUDAK-2 (see Colloquium news).

Thanks to all who travelled long distances and made presentations.

Let me get this straight... we should test on SSTV so we know we can do it
but not on CW. John, you have a rather consistent way of disregarding
logic when it suits you.

> >I have been licensed for 10 years.
> I have been licensed for 28 years.
> >I work CW only, because I
> >really enjoy it. I was a single mother with 3 kids (2 in diapers)

> when to listen for a UB5?
> >Enough said.
> Not nearly enough IMHO.
> I see absolutely no justification for this kind of snobbish elitism. The ham

Take the time (wasted though it is) to read the junk you wrote above and then
see who is the elitist snob here... I have been reading your drivel for some
time now and I am getting a little tired of you pushing your crap about how
great you are (anyone read sci.energy also?) and telling others they are
elitist snobs. I'm afraid YOU are the POMPOUS elitist snob here.

What you see no justification for is someone disagreeing with you. You
strike me as one of the bigotted jerks left over from the fifties who have
no respect for the ideas or feelings of others. All we have is your "word"
that you have done all these fantastic things both on ham radio and in the
nuclear industry. It has been my long experience that guys like you are
usually legends in their own minds. I have been a ham 27 years, have 160
countries on CW, a CERTIFICATE for 55 wpm, etc. etc. but I don't try to
persuade others I am God's gift to ham radio. Talk is cheap so put up or

shut up. Do something for the hobby instead of blowing your own horn and filling our feed with drivel.

Anytime you want to show how great you are at CW, you can find me around 7.035 with the CFO gang. Leave your code reader home, though, because I will be using a bug. You can also find Laryl around the same part of the band.

My appologies to the rest of the net for the length of this posting but I get tired of listening to these self righteous bigots and felt the need to let off a little steam. I will not be wasting the bandwidth again as I am sure my comments will go unheeded anyway.

73 to all and see you on the air, which is what ham radio is all about anyway.

1968. CW info needed

Newsgroup: rec.ham-radio
Date: 1989-08-06 01:27:00 UTC
From: CSMSCST@OAC.UCLA.EDU
Message-ID: <8908060701.AA15067@ucbvax.Berkeley.EDU>
Source record: 17548

Perhaps the CW buffs on this list can help me out. After being active only on VHF/UHF for several years, I've become interested in HF once again. I plan to run mostly CW since I don't figure that my restricted environment will let me have a competitive SSB signal (besides, I like CW). I used to use a Vibroplex bug since keyers were expensive, didn't seem to work well, and seemed to turn even good fists into QLF lids (still do, I gather).

There seems to be little written these days about CW. Can I use a bug to successfully key a modern transceiver -- I've heard that even small contact resistances can cause problems? Is Vibroplex still in business? Who makes a good keyer? Do I want a paddle with one or two levers -- what's the difference? What's a good paddle? And what is "Iambic" -- some kind of poetry?

Thanks.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

1970. Re: Here's a query for the gang... [VLF regulations]

Newsgroup: rec.ham-radio
Date: 1989-08-06 01:45:59 UTC
From: olsen@XN.LL.MIT.EDU
Message-ID: <1506@xn.LL.MIT.EDU>
Source record: 17544

In article <8908041934.AA17285@ti.com> rlwest@flopn2.csc.ti.com writes:
>Can anybody out there quote regulations (preferably point me to what FCC
>Rules & Regs paragraph or Edict or whatever) regarding 1750-meters?

Most unlicensed transmission is covered in Part 15 of the FCC rules.
Below 490 kHz, section 15.111 allows a maximum field strength of
2400/F(kHz) uV/m at a 300-meter distance. However, section 15.112
provides an exemption which allows VLF rigs to operate:

15.112 [Alternative provisions for operation between 160 and 190 kHz]
In lieu of meeting the requirements of 15.111, a low power communication
device may operate on any frequency in the band 160-190 kHz provided that
it meets all the following conditions:
(a) The power input to the final radio frequency stage (exclusive of
filament or heater power) does not exceed one watt.
(b) All emissions below 160 kHz or above 190 kHz are suppressed at least
20 dB below the unmodulated carrier.
(c) The total length of the transmission line plus the antenna does not
exceed 15 meters.

Sections 15.131 and 15.132 require most Part 15 comunication devices to
undergo FCC certification, but homebuilt equipment has it easier:

15.133 [Certification and identification required for home-built device]
A person who constructs not more than five low power communication
devices for his own use, and not for sale, need not meet the requirements
of 15.131 and 15.132. In lieu thereof, he shall attach to each device
a signed and dated label that reads as follows:

I have constructed this device for my own use. I have tested it
and certify that it complies with the applicable regulations of
FCC Rules Part 15. A copy of my measurements is in my possession
and is available for inspection.

]
]It strikes me that using the squelch output of the decoder chip as
]a 'stop scan' signal would turn a spectrum monitor/analyzer into
]a pretty FAST scanner. (Scan the entire range about 100 or more times
]per second...) I would think you would have to scan only 'small' ranges
]of frequency, however. Otherwise you would probably not be able to
]distinguish between very close signals.
]

...much more deleted...

Well...

You could separate close together signals if you used an FM discriminator
and a wide band IF. However, there are other problems with this scheme:
(1) Spectrum analyzer LO's don't normally have precise frequency
accuracy.
(2) For normal "scanning", one wants a series of channels, frequency
already known, so that you don't hear all the other miscellaneous
junk in the band.

Why does everyone believe that having signed the WARC treaty carries any weight??? There are lots of other countries that signed it and completely ignore whatever parts they want.

Just being cynical.

Subject: Public Perception of Ham Radio and Other Ramblings

My goodness! I go on vacation to L.A. for three weeks, and return to find several hundred pages of INFO-HAMS digests waiting for me to review. Well, let's see what's been discussed:

(1) Hundreds of lines relating to the legality of ordering pizzas via autopatch;
(2) The code/no-code wars going full force, which finally evolved into a discussion of the ARRL's no-code license proposal;
(3) A rehash of the HT's on airplanes bit;
(4) An interesting discussion on the effect of VHF gear on police radar;
(5) Some discussion on the public perception of ham radio;
and (6) Miscellaneous mods/assistance requests, satellite news, SWL news, etc.

(If I've left anything significant out, please don't take it as a slight!)

For what it's worth, here's my two cents worth on (1) through (5):

(1) I believe ordering pizza (or anything else) via autopatch is against the rules. If you disagree, fine, but it's your ticket on the line. Also, consider this: when you're using a repeater, you are in effect borrowing another ham's station. If he/she doesn't like the way you're using his/her station, then don't you think that he has a right to stop you from using it? If you don't like the way a particular machine is run, then use another or put up your own.

(2) The more I listen to this stuff, the more I swing into favor of a no-code ticket; however, can't we stop rehashing the same arguments that appeared here less than a year ago?

(3) Another dead horse -- the rules seem clear. I took my HT with me to California, was never questioned about it at an airport "security" check, and definitely *did not* use it in the air (35000' over the mid-Pacific is not the place to test if your HT interferes with navigation).

(4) Close to my heart -- I'm going into court in two weeks against a radar citation. I had my rig in the car when I got stopped; unfortunately, the rig was off, so there goes that defense. By the way, those who argue "why don't you just go the speed limit to avoid radar tickets" are ignoring (IMHO) two points: (1) on many roads, the posted limit bears no logical relation to the design limitations of the road and (2) the use of radar is by no means infallible (or, in some cases, ethical, but that's another can of worms).

(5) Finally, the reason for this posting. The public's perception of ham radio, or rather, the lack thereof. Several posters made comments like "ham radio is perceived as an anachronism", "hams are likened to CB'ers, fouling up everyone's TV", "hams are elitist", "being a ham used to command respect, but no more", etc.

How did we get in *such* a mess?

Well, let's look at how most people get their news, entertainment, and information about the world around them. That's right, from the TV. When was the last time you saw a ham portrayed positively on TV, other than a short blurb on Field Day? How about in a movie? Gee whiz, there's no role models on TV, so hams must not exist, right? With the computer revolution, I would even venture that many people see us as some kooky subset of "computer nerds", and we all know how Hollywood treats them ("Revenge of the Nerds", "WarGames", etc).

What do we do about this?

Darned if I know, I'm not a professional PR type. I do know one thing, though. We're great at advertising our successes to ourselves, when what we really need to be doing is advertising them to John Q. Public.

Consider this:

The greatest threat to the future existence of ham radio is
not the (impending) loss of 220-222 MHz,
not the fact that we do or do not have a no-code ticket,
not the fact that we have many MHz of unused spectrum just waiting to be grabbed,
not the fact that we may soon have Part 15 devices all over our bands,
not the fact that there are taxis on 10 meters,
but rather (IMHO) the PUBLIC'S LACK OF KNOWLEDGE about the amateur radio service. I would even say that the items listed above are *symptoms* of this lack of knowledge.

One other thing: I didn't see a single item in INFO-HAMS about the Docket 87-14 demonstration that supposedly took place at various Federal Buildings last month. Darn it, guys (and gals), this is a communications hobby, yet we can't even get the word out about something that important.

Intelligent discourse welcomed. Flames will be immediately diverted to the lava flows of Madame Pele, where they will be harmlessly absorbed and contribute to the growth of the Big Island.

73, Jeff WD6CQV/KH6

P.S. for you folks in L.A.: How do you manage to keep antennas from corroding away in the smog? I thought it was bad when I left in 1983, but it seems to get worse every time I visit, every two years or so.

=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=
THE SHORTWAVE LISTENERS ECHO-CONFERENCE
=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=

A Partial List of Participating Bulletin-Boards
Based on the Origin-Tags of Messages Posted
During the Past Six Months

Updated to 5 August 1989

In April 1986, Larry Digioia, sysop of the "Neverboard" in Pittsburgh,
Pennsylvania, organized a small group of Fido BBSs to exchange messages
related to shortwave listening. The Neverboard shut down recently, but
the SWL EchoConference lives on. Not only are there many more BBSs
involved (the best guess is over 200 now), but discussion has broadened
to include the recreational monitoring of all kinds of radio communications.

The following list is based on the origin-tags of the messages posted
in the SWL Echo during the last 6 months. BBSs listed in previous
versions of this list are NOT included this time unless they were the
source of a message during the past 6 months. We know there are many more
BBSs that carry the Echo than are listed here. But we aren't yet able to
distinguish the drop-outs from the inactives and the passively silent.
If you know of a BBS that is not listed here even though it is still in the
Echo, please advise Kirk Baxter, the SWL Echo Moderator (c/o the ANARC BBS,
phone number 913-345-1978; Fido 1:280/3).

Many message origin-tags do not give complete information. A
surprising number do not include a phone number. To fill in the blanks,
we turned to the 15 July 1989 FidoNet NodeList. There were a few
discrepancies between the NodeList and the origin-tags (e.g., the BBS
had changed its name, but kept the same phone number and node address).
In those few cases, we either went by the information in the message-tags
or indicated both names of the BBS.

I was never a bug man, but we had a bug in use on a Kenwood TS-940 at field day. It seemed to work just fine. I use a straight key, but also have a keyer. I've never seen a problem with a key. You may have difficulty with some sorts of electronic keyers though.

Still see vibroplexes for sale from the mail order place, so I guess their still being made. They even make a version without the twanger for connection to a key.

By the way, I used to have a wonderful $19.00 bug call...
WN3SBS
Actually, what I needed was a device to send exactly three dits in a row.

>Cute. Indicative of your operating practices?

No, its my CW handle, otherwise known as XM42 342. I don't use it on the
ham bands of course, but when in Rome ...

>> So you know when you CAN do it. What is your point?

>Let me get this straight... we should test on SSTV so we know we can do it
>but not on CW. John, you have a rather consistent way of disregarding
>logic when it suits you.

(a) My name is Mike, not John if you had bothered to look at my .signature
line!

(b) The point (which you seem to have missed), was that there are other
things besides CW that can be tested. True?

>Take the time (wasted though it is) to read the junk you wrote above and then
>see who is the elitist snob here... I have been reading your drivel for some
>time now and I am getting a little tired of you pushing your crap about how
>great you are (anyone read sci.energy also?) and telling others they are
>elitist snobs. I'm afraid YOU are the POMPOUS elitist snob here.

You seem to have conveniently missed the part about "all those no coders
who are just too lazy to take a CW test. THAT IMHO is pompous, elitist and
WRONG!

You seem to have me confused with someone else - I have never posted to
sci.energy! If you don't like my postings may I suggest the "k" key?

Just do me one favour - flame me about what I DID post, not something else
that you imagine I posted.

>What you see no justification for is someone disagreeing with you. You
>strike me as one of the bigotted jerks left over from the fifties who have
>no respect for the ideas or feelings of others. All we have is your "word"
>that you have done all these fantastic things both on ham radio and in the
>nuclear industry.

(a) I have NEVER done anything in the nuclear industry and never claimed
too. My brother in law (R. Burns) is polution control engineer at
Westinghouse Nuclear in Port Hope Ontario however. I'm not sure I see the
connection though.

(b) What fantastic things? My 1961 "certificate of proficiency in radio"?
My DXCC awards (see QST for the listings!).

>It has been my long experience that guys like you are
>usually legends in their own minds. I have been a ham 27 years, have 160
>countries on CW, a CERTIFICATE for 55 wpm, etc. etc. but I don't try to

1978. Videocipher 2 cracked?

Newsgroup: rec.ham-radio
Date: 1989-08-07 05:24:44 UTC
From: john@anasaz.UUCP
Message-ID: <571@anasaz.UUCP>
Source record: 17552
Cross-posted to: sci.electronics,rec.ham-radio,sci.crypt

Background: The VideoCipher 2 (TM General Instruments) is sold as
an authorized unscambler allowing consumers to watch encrypted
satellite TV signals. It uses DES encryption for key management,
and each unit comes with a unique set of internal DES keys that
are known to the authorizer. Programs are transmitted with the
audio information and the sync information encrypted using
a pattern that is based on a "program key". This key is
broadcast regularly, encrypted in the "monthly master key"
for the program source. The monthly master key is transmitted
regularly encrypted in the DES key for each AUTHORIZED unit,
allowing that unit to decrypt the program key and then get
the actual key for the pseudo-random bit sequence. [I hope
I have this right].

There have been reports of people selling "magic" versions of
this box that receive all channels. In fact, several of these
folks were arrested last year here in Phoenix. I know of one
technique that used to work - you could reprogram the uC
that decided when to use the program keys so that it would try
it on all channels. Since all (?) programs used to be sent with
the same program key or monthly master key, this used to be
feasable. However, presumably now they use different keys for different
program sources.

The DES keys and algorithm themselves are kept in RAM in a
battery backed up MCU, so that they are very difficult to get
at.

QUESTIONS:
(1) What are the other techniques for cracking this thing. [no - I
don't want to do it - my VC-II is just fine with me paying for
what I watch - I'm just curios]. Presumably they don't require
breaking DES, so I wonder how they do it. You would think that
MACOM (the original developer of the box) would know how to
make it commercially secure. By that, I mean that while a determined
hacker could crack one box, he/she would not be able to
crack enough boxes easily enough to make it commercially worth
while.

(2) I have heard that export of this device is illegal, and that
drug smuggling planes would sometimes return back south with
VC-II's on board. Is this true? Are they still illegal? How
do the various cable and private systems in Mexico, Carribean, etc
watch HBO, CNN, etc?

1979. Restoring Boat-anchors.

Newsgroup: rec.ham-radio
Date: 1989-08-07 09:22:33 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <07.Aug.89.10
Source record: 17553

Great to see Bob Parnass' posting on restoring 'Boat anchors' - glad to see there are 'Electronic historians' who actually USE the old gear...

I've restored some real vintage gear - i still use an AR88 (which is 22 years older than i am!) and a HRO-5 which is even older (UX5 valves with 2 volt heaters!).

Various hints for any of you planning to do likewise -
1) The electrolytics in power supplies definitely need reforming after a long period of disuse. If you dont, there will be a bang and a nasty smell.....! The damage caused by an exploding electrolytic can be enormous - smashed tube envelopes, wrecked variable capacitors etc.
I re-form my electrolytics by wiring a lamp bulb in series with the power supply - start off with a low-value bulb, say 15 watts, and work up to a bulb of the same power-consumption as the radio. The bulb also acts as a current limiter in the event that the mains transformer develops a shorted turn (quite common if the gear has been stored in damp conditons for a while!).

2) The grease in the bearings of tuning capacitors often solidifies with age and leads to 'lumpy' tuning or frequency instability. I have fixed a number of receivers with 'wobbly' tuning by taking the tunung capacitor out and slinging it in an ultrasonic cleaner for a few hours. Beware that you dont disturb the wiring too much when you take it out or you will probably screw up the tracking and dial calibration. re-lubricate the bearings with a good quality oil, but be careful - dont let the oil get near the plates of the capacitor, or it will pick up dust, which will do truly wonderful things to the dielectric properties of the capacitor. Similarly, dust in a plate tuning capacitor results in fireworks!(!)

3) Interstage coupling capacitors in older gear often go leaky - this can mean that you lose the grid bias - output tubes dont like this, their anodes glow cherry red in the dark! I test the capacitors by wiring them in series with a neon pilot light - then stick the whole thing across a DC supply of about 250 volts. If the neon flashes more than once, the capacitor is leaky. Just measuring the resistance with a DVM is useless, since the leakage may only show at high voltages.

4) Resistors (screen feeds, grid bias) may go high in value - upsetting the working point of the tubes. A voltage check usually shows up this sort of malady.

5) Often you will need to realign the IF stages. You may find someone has been there before you and cracked the ferrite cores by using the wrong tool. BE VERY CAREFUL - the cores may be brittle after all these years, in some cases if you crack the core, the IF transformer is scrap...

You may be able to dig the remains of the core out and insert a new one.
Some cores have a metal spindle extension fitted - the glue holding this
to the tuning slug often goes brittle with age, and the core drops off!(!)
so if tuning the adjuster doesnt seem to do anything, check that there
is actually something on the end. A blob of epoxy adhesive is the answer.
A drip of wax from a candle will hold the cores after realignment.

MAKE SURE you have the proper alignment instructions before you try
tweaking any cores though! Haphazard alignment can make things WORSE!

Performance - well, my AR88 isnt spectacularly stable (it drifts a bit
when you switch it on, but once warmed up its OK) and it hasnt got a digital
display, or memories, or scanning, but it does have a 5-position selectivity
switch (so you can use it to listen to AM broadcasts as well as CW!) and
it is pretty immune to overload (two tuned RF stages). The fact that it weighs
over 100 pounds and i had to reinforce the shack table is immaterial...
I've just got a brand new 6-volt power supply unit (ex-British-forces disposal
auction!) and will be interested in seeing how it runs off a car-battery.
I rather like the idea of getting an old, fifties-style AM transmitter,
or an early-sixties transceiver (National NCX5, KW Vanguard, or some of
the Hallicrafters stuff) as my next restoration job.

p.s. i operate mobile with a 1961-vintage, 90 watt 2-meter FM radiophone,
all tubes, 22 amps battery drain on transmit(!) Not a microprocessor,
transistor or memory in sight, just lots of lovely RF, and no worry about
antenna matching - it'll drive into a load of almost any SWR you can offer it!

1980. Reciprocal Licencing in Andorra ????

Newsgroup: rec.ham-radio
Date: 1989-08-07 09:29:39 UTC
From: Iain_Philipps.BridgeHouseRXUK@XEROX.COM
Message-ID: <890807-125533-1887@Xerox>
Source record: 17554

Hi Folks.

I'm not entirely sure that this message is being sent to the correct distribution list, so if I got it wrong, please no flames, just constructive criticism!

In a couple of weeks from now, I shall be taking a trip to Andorra, and hoping to operate from a hilltop on VHF. My difficulty is that I cannot get the current information regarding reciprocal licencing there, since the new CEPT agreements have caused some confusion - it used to be that the French authorities issued the permits from Perpignon, but have apparently ceased to do so since the adoption of the CEPT recommendations.

I have an expired permit for that country (C30DLA, in fact) and would very much like to get it renewed. Does anyone out there have current information?

1981. Doppler direction-finding equipment.

Newsgroup: rec.ham-radio
Date: 1989-08-07 11:02:29 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <07.Aug.89.12
Source record: 17555

In INFO-HAMS Digest V89 #526, <PZS@MERCURY.MCEO.DG.COM> was talking
about direction-finding equipment. One system i have used is that marketed
by DATONG ELECTRONICS LTD. in the UK. It consists of four whips that you
mount on the vehicle roof, and two signal-boxes (one that connects to the four
whips, the other attaches to the first box, and to a FM receiver).
The first box contains the switching/commutation unit that selects the
antennas in pairs, the second box takes the audio from the FM receiver and
displays direction on a circular panel of 16 LEDs). The price here in the
UK when i last saw it advertised was about 179 pounds inclusive of tax.
The thing certainly seemed to work quite well, but it was prone to being
deceived in areas where there was a lot of multipath reflection from
buildings, elevated roadways etc. Most doppler systems suffer the same way.
The basic unit is capable of operating over a wide frequency
range, you cut the whips to
the frequency you want, but obviously at lower frequencies, the spacing of the
whips becomes small in comparison with the wavelength of the received signal
and this must compromise accuracy to some extent.

1988. Re: Re: FT757 RF feedback problems.

Newsgroup: rec.ham-radio
Date: 1989-08-07 19:11:42 UTC
From: brucet@hpfcdc.HP.COM
Message-ID: <7880072@hpfcdc.HP.COM>
Source record: 17558

<...My Yaesu 757GX tranceiver seems to be very sensitive to RF-feedback...>

I spent several painful months tracking down some RF-feedback problems
in my Yaesu 767GX. It would start up the automatic antenna tuner
during transmit which would detune the antenna. Then the SWR protection
circuit would kick in and drop the power to something less that 10 watts.
Another thing that it would do is lock in transmit mode during CW.
If I didn't watch the power level with the meter, I could sometimes
send just a continuous tone! (You might have heard me on 40m).

My solution was to move my vertical antenna as far away from the shack
as possible and to connect an artifical ground to the rig. This is
helpfull but sometimes puzzling. Some band require maximum current
on the counterpoise to avoid these problems, others require minimum
current.

Oh well, at least I have a setup that works now!

Re: bridging the gap between electronics and chemistry

Beginner's synopsis:
Some RF components are silver-plated because silver oxide is a better conductor than copper oxides. For this reason, high-current RF devices (like tank coils) are plated to decrease their resistance (increase Q).

Linear amplifier design has taken me into the realm of chemistry. I'd like to silver-plate a tank coil (and maybe some switch contacts). So far, all I have crated is a gallon milk-jug full of black goop (AgO ?), a copper coil coated with same, and several destroyed bridge rectifier chips. Electrolysis apparently takes a lot of current. :-o

I've used tap water, NaCl, white vinegar, and H2SO4 as electrolytes. I don't remember if AgCl or AgSO4 are precipitates, which may explain the black goop in the bottom of the jug. Why H2SO4 ? Well, I had some in a battery, that's why. I've read that AgNO3 is the right thing to use, so I may just need to find some H2NO3.

Any chemists out there have a sure-fire process ? I'm tired of reducing silver, a truly beautiful metal that costs $7/ounce, to nondescript black goop. Goes against my sense of decorum as well as my sense of economy.

1992. Atari ST graphic satellite tracking program

Newsgroup: rec.ham-radio
Date: 1989-08-07 22:55:56 UTC
From: logajan@ns.network.com
Message-ID: <1530@ns.network.com>

Although this is machine specific (and it is written in GFA Basic, which
makes it language specific) you might never the less be interested to know
that I have just finished a graphic satellite tracking program that
displays the current positions of the earth satellites found in the
NASA orbital elements posted often to sci.space by T. Kelso.

It reads the element file, as is, and simultaneously tracks all the satellites
found there on a world map. It is a very pretty display. It can update the
positions of 100 satellites in about 6 seconds.

It is written in GFA Basic (2.0) for the Atari ST computer. The source code
is available from me for the asking, and it should appear in
comp.sources.atari.st real soon!

If you want it, drop me a line.

1993. Kenwood TH-75A HT for SALE

Newsgroup: rec.ham-radio
Date: 1989-08-07 23:00:01 UTC
From: frank@ut-emx.UUCP
Message-ID: <16699@ut-emx.UUCP>
Source record: 17574
Cross-posted to: rec.ham-radio.swap,rec.ham-radio

I won the pre registration prize at the Texas VHF-FM Summerfest
in Austin, Texas on 5 Aug 1989.

The radio is a Kenwood TH-75A Dual Band HT.

It covers the 2meter amateur band and also the 438-449.95mhz
portion of the 70cm band.

The radio is quite nice, but currently I do not have a license and
when I do get one, I plan to work more in the HF bands.

So the radio is for sale.

Kenwood list is $549, Austin Amateur Radio, sells it for $475, and
one of the dealers in '73 had it listed for $469.

I would like to sell it for $450 or trade if for one of the following:

ICOM 735 or 725 (Note, an IC-735 was the Grand Prize won by
a nice retired TSTI instructor, couldn't
talk him into a trade. :^)

Kenwood TS-140 or TS-680
Yaesu FT-575GX

I would like to reiterate, this is a very nice radio and if I was planning
2m/70cm activity I WOULD KEEP IT! If I don't get the $450, I might anyway.

I'd also like to thank the Texas VHF-FM Society for the VERY NICE prize!
(Yes, Joe Makeever, I still plan to get my license :^))

If you have a unit to trade or would like to buy this FM HT, contact
me at home (512)-244-0625 (ans. machine) or e-mail to me.

1> "2) Phone patches or autopatches involving the buisness affairs
1> of any party must not be conducted AT ANY TIME.[Their emphasis]
1> The content of any patch should be such that it is clear to
1> any listener that buisness communication is NOT involved.
1> Particular caution must be observed in calling any buisness
1> telephone. Calls to place an order for a commercial product
1> [read pizza] must not be made, nor may calls be made to one's
1> office to receive or to leave buisness messages."

2> Sorry dude, but that isn't an FCC ruling. If you read the fine print, you'll
2> find that that little piece of regulatory wisdom was written by the ARRL,
2> and not our illustrious fools in Washington. That policy was formulated
2> in the 1960's, when it was illegal to connect anything to a phone line
2> except Western gawdawful Electric equipment, and way before the breakup
2> of the Bell monopoly. So you see, at the time, we had a neat thing
2> going, and the ARRL had to be about as careful as Caesar's wife. Times
2> have changed.

Times have changed, but this rule is essentially the same. The text enclosed
is in fact the ARRL's interpretation of the rules. The ARRL has often been
quite liberal on interpreting rules, as they often do say to go ahead and just
do things unless there is a clear rule against it.

Ultimately we all have to interpret the rules for ourselves. Should there
ever be a citation or even a court hearing on the matter, then maybe we will
have a better idea. I've read about many hams losing their tickets for some
violation of rules, but never for ordering a pizza (or other product), but on
the other hand, I have never heard anyone do that either.

> Title 47 is pubished in four volumes, the last of which covers Parts 80 to
==== -------
Hmmm... I happen to have all FIVE volumes of Title 47, as does the University
of Illinois Library, Federal Documents section. They are divided as follows:
vol 1: parts 0-19
vol 2: parts 20-39
vol 3: parts 40-69
vol 4: parts 70-79
vol 5: parts 80-end

> 100 of the FCC rules (including Amateur, Maritime, Aviation, GMRS, R/C,
> CB, and sundry other radio services). The price for this volume is $19.00
> and the stock number is 869-004-00176-2.

It is still the LAST volume, but it is NOT the fourth. This is the best
volume to have if you are going to get just one, since it covers most of the
interesting parts as mentioned above. If you can go for TWO, get the FIRST
volume also, which covers goodies like Part 1 (general procedures, filings,
motions, etc.), Part 2 (allocations, a list of the ENTIRE SPECTRUM as
allocated in all 3 regions of the world, text of all allocation footnotes,
call sign assignments, and emission mode designators in full), Part 15
(unlicensed operations), Part 17 (Towers and stuff), Part 18 (Industrial,
Scientific and Medical). If you are interested in broadcasting or cable TV
rules, you want volume 3 for parts 73-76.

> out.
...
> What are the regulations regarding VLF operation?
...
> Can anybody out there quote regulations (preferably point me to what FCC
> Rules & Regs paragraph or Edict or whatever) regarding 1750-meters?

---BEGIN--FCC--RULE--TEXT---

15.111 Operation below 1705 kHz.

A low power communication device may be operated on any frequency between
10 and 490 kHz or between 510 and 1705 kHz subject to the condition that the
emission of RF energy on the fundamental frequency or any harmonic or other
spurious frequency does not exceed the field strength in the following table.

Frequency (kHz)	Distance (meters)	Field strength (uV/m)
10 to 490	300	2400 / F (kHz)
510 to 1705	30	24000 / F (kHz)

15.112 Alternative provisions for operation between 160 and 190 kHz.

In lieu of meeting the requirements of 15.111, a low power communication
device may operate on any frequency in the band 160-190 kHz provided it meets
all the following conditions:
(a) The power input to the final radio frequency stage (exclusive of
filament or heater power) does not exceed one watt.
(b) All emissions below 160 kHz or above 190 kHz are supressed 20 db below
the unmodulated carrier.
(c) The total length of the transmission line plus the antenna does not
exceed 15 meters.

----END--FCC--RULE--TEXT----

1. The power level is one watt, measured at INPUT.

2. No restrictions on emission mode appear to exist.

3. The antenna height and size PLUS transmission line length are limited
to 15 meters (close to 50 feet).

4. You can use the provisions of 15.111 instead if you wish. Other rules
still apply regardless of whether you operate under 15.111 or 15.112.
See Part 2 Subpart J and Part 15 Subparts A, B and D of the FCC rules.

> ticket; however, can't we stop rehashing the same arguments that appeared here
> less than a year ago?

The arguments are the same and the rebuttals are the same. I for one do not post arguments for a codeless license, but I do repeat the same rebuttal for the same argument that comes up against a codeless license. It seems that many hams have not thought about the logic involved, and missed the rebuttal the first time around, and end up posting the same wrong arguments every time. If that goes unchecked, they will probably continue to use the same arguments everywhere else they go, and confuse lots of people as a result. That is the reason I do post my rebuttals, and the debate apparently goes on.

> The greatest threat to the future existence of ham radio is

I don't know that much about microwave radiation so perhaps there is an obvious answere, but is it possible to retransmit the same signal 180 degrees out of phase? If you can pull that off, the officer may not get any signal reflected at all. I've been told that something similar is done to silence atack helocopers. They retransmit it's noise over loud speekers 180 out of phase and it sounds like a wisper. But then if you're not licensed on that band, you could have a problem.
Paul

!!!Danger Will Robinson!!!
!!!Entering Proton - Plasma Cutting Torch FLAME Mode!!!

1. The quote that you posted comes from pages 7-6 - 7-7 of "The FCC Rule
Book", and was written by the ARRL. If you read it carefully,
you would have noticed the first sentence of the first paragraph
on page 7-7 reads:

"It is the policy of the American Radio Relay League to safeguard the
prerogative of amateurs to interconnect their stations, including
repeaters, to the public telephone system."

The paragraph concludes:

"All amateurs are urged to observe these standards carefully so our
traditional freedom from government regulation may be preserved as
much as possible."

This paragraph was written over 20 years ago. Not only is it out
of date, due to the Consent Decree, but the legal reasoning is
incorrect, which made it invalid at the time it was written.
As per B&B 's Conlaw text, "that which is not expressly prohibited

is allowed" is a most fundamental principle of the American legal system. To avoid an action based on a fear that such an action would later be made illegal is not only childish, it is downright cowardace. In fact, if it were not for such acts by Maxim, Hoover, and others, Ham Radio wouldn't exist. Read Desots's "200 Meters and Down" for some perspective.

2. You forgot 97.114(b)(3), which prohibits third party business traffic. If you're going to charge me with a violation, at least get the cite right.

3. Part 97 defines business communications as an act which facilitates the a regular business transaction. This fails to prohibit ordering a large Stromboli from Stuft's for the following reasons:

a) It is not a REGULAR transaction. If I use an autopatch every night of the week to order a pizza, then it becomes a regular transaction. The reason for prohibiting this is that, if I know in advance that I'll be transacting business on a regular basis, I should subscribe to another private radio service, which is targeted at such a usage base. Legally, regularity implies periodicity and vice versa, so if there isn't any periodicity to your pizza habit, then you've ok.

b) According to B&B's Contracts and Biz Law text, a business transaction consists of a solicitation, an inquiry, an offer, a bid, and an agreement, minimally. Unless Stuft's advertises on the repeater, the autopatch does not consititute a business transaction. This is why, for example, swap nets are allowed to exist; the bid and agreement process are transacted elsewhere.

4. If you want to play lawyer, go take some law courses.

Blech. Flame OFF.

>QLF lids (still do, I gather).

I would disagree slightly. Keyers work quite well, can still be somewhat expensive (for the really good ones), and make it possible for those of us who are not macho enough to run the Vibroplex bug well.

Well used, a bug can be an amazing machine. Misused, it can be a nightmare, sending dits at twice the appropriate speed.

>There seems to be little written these days about CW. Can I
>use a bug to successfully key a modern transceiver -- I've
>heard that even small contact resistances can cause
>problems?

Sadly, it doesn't seem to be politically correct to say anything about CW (except for those who claim it is obsolete).

Different transceivers have different problems. The voltage drop of a series protection diode was enough to make the FT101ZD not key -- it really wanted a very low voltage across the contacts. When using a straight key, you could hear variation in the sidetone as you pressed the key harder (not the worlds best straight key, but not the worst, either).

The recent Uniden 2510 would provide a good strong sidetone in the same situation, while switching the radio from receive to transmit, but it would not actually emit any RF (other than its strong backwave).

Some other rigs (such as the Heath HW-8, HW-9, HW-99) didn't care, they would key just fine.

> Who makes a good
>keyer? Do I want a paddle with one or two levers -- what's
>the difference? What's a good paddle? And what is "Iambic"
>-- some kind of poetry?

Preferences for keyers vary. I have used several types, and they do feel different.

Most keyers made nowdays are "iambic". They have two paddles, and the added feature that if you hold both paddles in at once, you will get an alternating .-.-.-.- and you can actually use the latches in the keyer to generate things quite nicely. I believe Bencher packs a little essay on the subject in with their iambic paddles. (I like them, but there are other good ones, as well.)

Dave, I am sorry to say that even if you are right now, you will be wrong
as of Sept 1, 1989.

From FCC 89-180 -- Part 97 Rewrite EFFECTIVE SEPTEMBER 1, 1989

97.113 Prohibited Transmissions

(a) No amateur station shall transmit any communication the purpose of which
is to facilitate the business or commerical affairs of any party. No station
shall transmit communications as an alternative to other authorized radio
services, except as necessary to provide emergency communications. A station
may however, transmit communications to:

[Then things like public gathering, broadcasts, emergencies, etc]

Contemplate the phrase "business or commerical affairs of ANY party."

Asking someone to pick up milk, soda, bread, etc is not really allowed,
calling a Business is clearly not allowed.

Sorry Dave.

By the way, long time no see, how's it going?

}> not the (impending) loss of 220-222 MHz,
}> not the fact that we do or do not have a no-code ticket,
}> not the fact that we have many MHz of unused spectrum just waiting to
}> be grabbed,
}> not the fact that we may soon have Part 15 devices all over our bands,
}> not the fact that there are taxis on 10 meters,
}> but rather (IMHO) the PUBLIC'S LACK OF KNOWLEDGE about the amateur radio
}> service. I would even say that the items listed above are *symptoms* of this
}> lack of knowledge.
}You know, this makes a lot of sense.

Absolutely right. If we fix the public's lack of knowledge about ham
radio, the rest of the problems above will take care of themselves.
No-code won't fix the problem, and will introduce more problems.

}> One other thing: I didn't see a single item in INFO-HAMS about the Docket 87-
}> 14 demonstration that supposedly took place at various Federal Buildings last
}> month.

This is news to me. Who set it up, and when was it?
I saw nothing about it whatever.

2009. IF FILTERS

Newsgroup: rec.ham-radio
Date: 1989-08-08 12:37:14 UTC
From: MORRIS%ORN.MFENET@CCC.MFECC.LLNL.GOV
Message-ID: <890808053714.36200230@CCC.MFECC.LLNL.GOV>
Source record: 17564

Group:

No, I'm not going to ramble on about pizzas or no-code. I need
to find a supplier of cheap 2 to 4 pole IF filters in the 20 to 80 Mhz
range. This is my idea: build a simple, cheap, and compact FM reciever
around the TDA7000 FM chip. The TDA7000 is a complete FM system on a chip
with a low IF - less than 100khz - so no coils are necessary - it is all
done with active filters. The bad thing is the image response and I plan
to get around it by a double conversion scheme with some broad band
components. I hope build a general purpose building block FM reciever
that can be used for everything from R/C to 2 meters.
The system layout would be this : an input bandpass filter followed
by a diode mixer, a diplexer and IF filter, maybe an amp, and then the
TDA7000 with whatever at the tail end. The IF filter doesn't have to be
great, but it has to kill everything about 50Khz off channel. My hopes
are for a 10 to 25Khz bandwidth at the 3dB points and maybe 4 poles.
Running the TDA7000 IF at 50 to 80Khz would be ideal. The active filters
would take care of the rest.
It seems to me that there are some SAW filters or whatever in
the 20 to 80Mhz range that aren't too expensive ($20<) that would do the
job. I need the data on them too? Any help?

P.S. If you have the TDA7000 data you know that the chip uses some
compression on the FM deviation. I think I can get around this by over
filtering the frequency lock loop and replacing the local Osc. tank by a
crystal. Has anybody out in netland tried using this chip? Let's can
the code-no-code/pizza stuff for a while and get back to 'lectric stuff!

>Mark Holtz - / mholtz@sactoh0 asks:
>
>I am still a bit new here, but I have a couple of questions....
>
>1. (No flames please) What is the difference between Ham radio and
>regular CB radio?

Ham radio is established for the purpose of experimenting with the design
and construction of radio equipment that can be used legally over the air.
Additionally, it provides the experimenter the opportunity to increase
ones skills in the radio frequency field (pardon the pun). Another purpose
of the amateur radio service is to provide backup disaster communications
in the event of emergency to public emergency orgainzations. There are
several other purposes for the group that will probably be described in
postings other than this one. Ham radio (Amateur Radio) operators are
licensed by the Federal Communications Commission through a network of
volunteer examiners. There are several classes of Amateur Radio Licenses
with different operating priviledges. They are least priviledges to most:
Novice, technician, general, advanced, and extra classes. Obtaining
the license requires passing a Morse code receiving test (5 to 20 words per
minute, depending upon the license class) and passing a radio theory test.
DON'T BE AFRAID OF LEARNING MORSE CODE. There are several easy methods
of doing it. One of my co-workers did it in two weeks and later, obtained
his general class license a few weeks later.

Citizens Band is intended for short range communication (around 20 miles
minimum). Ham radio has no distance limitations. You cannot legally
repair or adjust a CB transmitter unless you posess a commercial radiotelephone
license. You can design, repair, construct, and adjust Ham radio transmitters
and operate them with an Amateur Radio License (it's fun).
Citizens Band is limited to the 11 meter band. Ham radio has several
(and then some) frequencies available. CB is also limited to 5 watts of
power to the final amplifier. Amateur Radio power limitations are 2000 watts.

>
>2. What is "DXing"?
DXing is talking via radio over long distances.

>
>3. I own a Pro-2004 scanner. What will be a good antenna to use
>with this scanner?

An outside ground plane antenna would probably be your best bet. They
are also sold at radio shack.
>
>4. Are there any amatuer radio groups in the Sacramento area?

YES!!!!!

They are: The Sacramento Amateur Radio Club
River City Amateur Radio Club
North Hills Amateur Radio Club
Hewlett Packard Amateur Radio Club
Sierra Foothills Amateur Radio Club (Auburn)

Their addresses and newsletters are found at HSC Electronics,
and Quad A's Electronics.

If you are interested in obtaining your license, many of the above
clubs teach classes, usually once a week in the evenings that will
help you learn the code, theory, and get you in touch with a lot of
local hams that will be more than happy to assist you in obtaining
your license.

Also, e-mail me for more information if you wish.

2012. (Potential) FCC nominees

Newsgroup: rec.ham-radio
Date: 1989-08-08 17:53:00 UTC
From: denver@NARDAC-NOHIMS.ARPA
Message-ID: <8908090702.AA18669@ucbvax.Berkeley.EDU>
Source record: 17583

Some time ago, there was a discussion about having a nominee to the FCC who is also an amateur radio operator. I think the point is valid.

So let's do a canvassing to find out who some eminently qualified individuals are who also meet this criterion (as well as never having smoked dope, cheated, or owned stock in any communication company :-). If we find some qualified, willing, and able individuals, then I think that it would be easier to 'help' the President find these people the next time he needs a good nominee.

The floor is open for "nominations".

2013. New scanner -- Radio Shack PRO-2022

Newsgroup: rec.ham-radio
Date: 1989-08-08 18:06:41 UTC
From: parnass@cbnewsc.ATT.COM
Message-ID: <2312@cbnewsc.ATT.COM>
Source record: 17608

Watch for the new 200 channel PRO-2022 scanner in the
1990 Radio Shack catalog. Physically, it will look
like the PRO-2005, complete with fold down front feet.

However, frequency coverage will not be continuous.
It will cover the same bands as the discontinued PRO-2021,
with the addition of 800 MHz (minus cellular phone segments,
of course). The PRO-2022 will be priced at $350.

I have the R4 (just bought the R5 upgrade), and have been very pleased with it.
Assembly and setup were simple, match is near 1:1 on 10/15/20. (I haven't
gotten my WARC crystals yet!)
I pretty much work anyone I want to, just don't get those "big signal" sig
reports. It seems to do quite well on 15...I get through pile ups pretty
easily.It isn't very competitive on 20; too many big guns there, but it manages.
BTW, I'm running a C-Line barefoot into about 50' of RG8.

2020. An antecdote regarding Radar Detectors...(from a non-ham observer)

Newsgroup: rec.ham-radio
Date: 1989-08-08 22:10:42 UTC
From: rlwest@flopn2.csc.ti.com
Message-ID: <8908082351.AA07302@ti.com>
Source record: 17588

This was sent to me as a response to some of the comments on Radar Detectors
I forwarded to a non-ham militaryphile, and he sends this back...

]From: FLOPN2::PANZER "Transveloped from another life form"
]
]Subj: Pass on to the radar exploder on your bulletin board
]
] As the story goes...an Army medic is driving the perimeter road at White
] Sands Missle Range to spend the day waiting for someone to get hurt at a
] Nike Herc unit (I heard the story first hand from the medic). Along the
] way he sees a police car has setup a speed trap. When he gets to the
] unit site at the range, he goes into the operations van to checkin and
] mentioned to the guys sitting there that a speed trap has been setup.
] "Where?" asked one of the radar NCO's.
] "Right before the turnoff for the road back to the base" replied the medic.
] "No! On the map! Show me on the map!" promted the radar NCO.
] The medic pinpoints the location on the Army topographic map while a couple
] of the radar techs study the contour lines on the map.
] "Hey, that's line of sight!" one of them decides.
] Next we see one of the big radars they used to track the Nike Herecules
] missles into the outer atmosphere sling round and drop to near horizontal,
] pointed on an azmuth back toward the point on the map.
] The radar tech calmly said, "Speed trap?" he hit the radar on switch,
] and then turned it off again, "there ain't no speed trap there."
]
]Regards,
]
]Roy,
]PANZER@FLOPN2.CSC.TI.COM
]

I have no opinion regarding the veracity of this antecdote. Judge for yourself.

From: phil@ux1.cso.uiuc.edu
Message-ID: <30500123@ux1.cso.uiuc.edu>
Source record: 17611

A truly secure cryptographic system requires that the transmission of the keys be secure in the first place.

Consider yourself to be the engineer who designed the unit, so that you know all about the system, except the keys. In order to make sure that YOU do not know the key, the master key is transmitted securely to ONE unit at a time, using the builtin key for that unit. But someone has to build in the keys.

One method I first heard that was being used was to program multiple units with the same keys, of someone who subscribed to all services. Then when his version of the master key was transmitted, every pirate unit which had a copy of his key would also pick it up. Trouble is, the pirate unit "pointed" back to the person who had the base subscription. "They" can then investigate to see if he was the one who copied them, or if not, just change his key and unsubscribe the pirated key. Still, it requires someone getting their hands on a pirate unit to identify a pirated key.

A clever programmer/engineer could modify a unit to actually have multiple keys so that if one was unsubscribed, it could still get the changing master key via some other subscriber key. This trick can also be resisted by leaving known pirate keys "subscribed" but transmit a false master key to them when they are discovered.

If the same master key is on each service, then an altered box could violate subscription information and use the master key to decode another service. I know that this has been used on some cable systems withouth even breaking in to their decoder boxes. One simply subscribes to one channel, and then puts a channel selector ahead of the box, and a modulator that shifts the I.F. output up to the decoded channel's frequency. A bypass filter would be used to send all other frequencies into and out of the decoder, allowing the unit to believe it was still connected to the cable system, and the cable operator to believe the box was there as well (when it is polled).

There are rumors that DES can be cracked. I've heard that agencies such as the NSA forced the DES system to use 56 bit keys instead of 64 bit keys so that the feasibility of cracking them would be within their computing power. I suspect it takes a lot to crack a DES code, and a home PC is likely unable to do it yet. Perhaps the reason to force the system from 64 to 56 was to cover up just how easy it really was in the first place; had they left it as 64 bits, many would have suspected that they could crack that easily, which might in fact be the case.

Ultimately, public-key cryptography is the way to go, but broadcasting cannot use it since it is sending out just one signal for everyone. The method I might prefer is one where the keys are transmitted to subscribers via a floppy disk on a monthly basis. It is not secure, but it at least forces the

pirating system to sustain contact with all its subscribers, making it easier for investigators to track down the pirating of copied key disks.

Source record: 17612

I'm sure this will be repeated, but not everyone has read it yet, so here goes again...

The rec.ham-radio newsgroup is distributed in the form of an automated digest through ARPAnet and Defense Department facilities. The policies of the DoD prohibit even the posting "For Sale" type of ads for which no profit is made. Whether we like that or not, those are the rules there.

So that rec.ham-radio can continue to be distributed via that channel, we have formed a secondary newsgroup called rec.ham-radio.swap, which is not carried into ARPA, so that we can still post "For Sale" items, and restrict the distribution to just those networks that allow it.

For the sake of subscribers who read the INFO-HAMS digest, please post all "For Sale" and "Wanted to Buy" type of announcments on rec.ham-radio.swap. Those of you who are INFO-HAMS subscribers with such a posting, you should pass it on to someone who can post it in a newsgroup to do this for you.

Thanks and 73's de KA9WGN

Cross-posted to: rec.ham-radio,sci.electronics

Before you read the signature and say: "Ah ha, who better than a Kodak person to talk about silver chemistry" let me add that the chemicals division is (organic) chemicals, plastics, and fibers. That said.....

The simplest method of silver plating small parts around the home is to use an electroless silver plating method. The application to tank coils and VHF/UHF cavities is ideal. Electroless silver produces very thin coatings, but these are all that are usually necessary. I have found very little difference between silver-plated coils/cavities compared to shiny copper in respect to efficiency or Q. However, as both surfaces tarnish, the silver plated surface will retain its high Q much longer. Electroless silver will provide just enough silver on the surface of copper or brass to prevent the corrosion of the base metal. Heavy silver plate might be slightly better in electrical performance, but the effort (and cost and complexity) is hardly worth it.

One of the easiest electroless silver plating compounds is made by a company called Cool-Amp. This is a powder that when moistened slightly and rubbed on clean copper or brass produces a nice shiny silver coating. Several months ago a pound cost about $70. Don't let the price scare you because a pound will go a long, long way. It will probably last your whole ham club many years if you use it properly. I have made something similar using silver chloride, sodium chloride, and potassium tartrate but the Cool-Amp works better. After buffing the copper surface with steel wool, or even better - a Scothbrite scouring pad, rub the slightly moistened powder on the copper using a paper towel. Make the powder too wet and it doesn't work! You might consider using rubber gloves unless you like having green edges on your fingernails. Finish off the plating with a rinse of clean water. After the object is dry, a coat of clear acryllic spray will help to keep the surface shiny (acryllic plastics also have low dielectric losses).

The ARRL Letter, Volume 8, No. 15, July 28, 1989 Part 1 of 4

Published by:
The American Radio Relay League, Inc.
225 Main St.
Newington, CT 06111

Editor: Tom Hogerty, KC1J

Material from The ARRL Letter may be reproduced in whole or in part, in any form, including photoreproduction and electronic databanks, provided that credit is given to The ARRL Letter and to the American Radio Relay League, Inc.

ARRL BOARD OF DIRECTORS VOTES TO PROPOSE CODELESS AMATEUR LICENSE CLASS

The American Radio Relay League Board of Directors held its second 1989 meeting in Windsor Locks, CT on July 21-22.

Major issues addressed at the meeting icluded:

After extensive discussion, by a vote of nine Directors in favor to six opposed, it was agreed that a proposal recommending a codeless class of amateur license will be presented to FCC in the form of a Petition for Rulemaking incorporating the following elements:

- The examination will consist of Element 2 and an expanded Element 3A having additional questions, including ones related to Morse code.

- License examinations will be given through the VEC examination system.

- To upgrade to Technician, the new licensee will pass a five word per minute Morse code test administered through the VEC system.

- Call signs shall be assigned from the Group D Call Sign Block.

- Frequency privileges shall be 220 MHz and above, with output power limited to 250 watts.

- The licensee shall not be the control operator of a repeater or auxiliary station.

While there was concern that there might be confusion with an unpopular FCC proposal in 1974 to create a new class of license called Communicator, the

Board felt this was the most descriptive name for the new license class. The ARRL proposal is similar to the abandoned FCC concept in name only.

In another important action, the Board adopted a policy to oppose any fees (see the following item) for Amateur Radio station and operator licenses that exceed either the actual cost of administration or the fees charged for any other licenses used for non profit purposes. It pledged to oppose any fees for license modifications or upgrades, except those used to reimburse VEs and VECs for their expenses, and to oppose fees for reciprocal permits or for RACES, military recreation, or school club licenses. In the fight, the League will be using the Capitol Hill resources it developed in the effort to defend 220 to 222 MHz.

The Board selected these award recipients: Sister Alverna O'Laughlin, WA0SGJ (1988 Humanitarian of the Year); Fred Cady, KE7X (1988 Herb S. Brier Instructor of the Year); Phyllisan West, KA4FZI (Professional Instructor of the Year); and Kevin Biekert, KB5AQV (1988 Hiram Percy Maxim Award).

The full text of the Minutes with accompanying story will appear in September QST.

FCC "COST OF REGULATION" MAY REACH INTO YOUR POCKETBOOK

Word has reached ARRL that the House Energy and Commerce Committee is proposing a budget reconciliation package that includes increases in FCC "cost of regulation" fees implemented four years ago by Congress. At the time of their implementation, Amateur Radio was exempted from these fees. That exemption may now be in jeopardy.

The budget reconciliation package that was marked and approved by the Committee on July 13, proposed an application fee of $30.00 for each of the following actions involving amateur licenses or permits:

- New License

- Modification of License

- Renewal of License

- Reciprocal Permit for Alien Amateur License

- Renewal or Modification of Amateur Club, Races, or Military Recreation Station License

The $30.00 fee is the same as is being proposed for a wide variety of other Private Radio licenses (ship, aircraft, land mobile, GMRS, etc.).

As indicated in the lead story, the ARRL Board of Directors has pledged to oppose this scheme.

The ARRL Letter, Volume 8, No. 15, July 28, 1989 Part 2 of 4

W1AW REDEDICATION

More than 200 people from all across the nation gathered at The Hiram Percy Maxim Memorial Station, W1AW, for its rededication on July 20. Rev. Michael F. Mullen, C.M. (WB2GQW), 1987 recipient of the ARRL International Humanitarian award gave the invocation. ARRL President Larry E. Price, W4RA, was Master of Ceremonies and opened the event with comments of welcome.

Other guest speakers included Steven Bafundo, President of the Newington Chamber of Commerce, Bobby Baines and Michael Riley, KX1B, of the American Red Cross, ARRL Honorary Vice President, George Hart, W1NJM, Paul Perakos, Assistant Treasurer for the Connecticut Bank and Trust Company (CBT), and Fred Hammond, VE3HC, President, Hammond Manufacturing Company, Ltd.

On behalf of ARRL staff, David Sumner, K1ZZ, ARRL Executive Vice President stated that the HQ staff was proud to be a part of a 75- year tradition. He went on to say, "W1AW is a monument to one man, Hiram Percy Maxim, without whose vision, ARRL and probably Amateur Radio itself would not exist. The renovated station is testimony to the love of that man, and of what he created, that is felt by thousands of people in this country, and overseas."

President Price then cut the ribbon and W1AW was open for tours by the guests in attendance. A number of on-the-air contacts were also made from the newly renovated W1AW.

AMATEURS ASSIST FCC FIELD OPS

When, in early June, the FCC Field Operations Bureau needed some known "targets" to test new direction finding gear, they called ARRL for help. ARRL provided a list of amateurs living near selected major cities.

Ultimately, FCC was able to pinpoint target stations quite accurately. Assisting were W6BF (Los Angeles), W5OVH (El Paso), W4MI (Memphis), KA0CDN and W0IJR (Denver), K0PCK (St. Louis), and K0GA (Minneapolis).

The tests were run on June 13, using state of the art gear by Zeta, using correlative interferometry techniques. The equipment, which is transportable, is able, with options, to DF anywhere between 1.5 and 1000 MHz. A bearing taken by just one unit can give an indication of location. Previous direction finding apparatus usually requires at least two cross bearings.

FCC ACTS IN PR DOCKET 88-507

The Federal Communications Commission has amended its Maritime Services Rules restricting front panel frequency selection capability of VHF maritime radio station transmitters to maritime frequencies only. There will be a one year phase out period ending on August 1, 1990 for the manufacture and importation of such transmitters and two year phase out period for their installation. Equipment installed to the cut off date will be "grandfathered" for use at the same maritime station.

FCC stated that some VHF transceivers being manufactured for maritime service are capable of being programmed to operate on other than the

maritime channels. This has resulted in an increase in harmful interference caused by operation of maritime stations on unauthorized frequencies.

Addressing a similar problem in the Private Land Mobile Radio Services, the Commission adopted rules that restrict the manufacture and use of private land mobile transceivers that employ programming schemes permitting station operators to alter the frequencies that can be selected for transmission.

The ARRL Letter, Volume 8, No. 15, July 28, 1989 Part 3 of 4

FMRE HOSTS ARRL REPRESENTATIVES AT CONVENTION

ARRL Executive Vice President, David Sumner, K1ZZ, and IARU Assistant to the Secretary, Naoki Akiyama, N1CIX/JH1VRQ were guests of the Federacion Mexicana de Radio Experimentadores at their National Convention in Guadalajara on July 8-9. The Convention was opened with a ceremony in which the Governor of the State of Jalisco participated, and at which a representative of the Secretaria de Comunicaciones y Transportes (SCT) delivered an address most supportive of FMRE.

Messrs. Sumner and Akiyama wereprovided with courtesy operating permits by the SCT ot operate as XE1/K1ZZ and XE1/N1CIX during the convention.

At the closing banquet, K1ZZ delivered a speech and presented a commemorative plaque on behalf of the ARRL in Spanish -- which he doesn't speak. Dave says that, even with Nao's expert coaching, it was "one of the more difficult speeches I've ever delivered!"

ROSS BEVILLE, W3GGW, "FATHER OF FM STEREO" SK

Ross H. Beville, 78, died on June 18 in Amarillo, TX. Mr. Beville had been a Radio Amateur since te 1920s. He was vice chairman of an industry panel that set FM broadcasting stereo standards, and was the area FCC/CONELRAD industry coordinator in the 1950s. Beville was a member of the Association of Federal Communications Consulting Engineers and the Washington Executive Broadcast Engineers. He was named "Father of FM Stereo" by the National Association of Broadcasters journal "Radio Active" in October 1976.

ARRL VEC CELEBRATES ITS FIFTH ANNIVERSARY

On Ju 21, 1984, ARRL President Larry Price, W4RA, put his signature on the VEC Memorandum of Agreement at the ARRL National Convention in New York City. This document authorized ARRL to accredit Volunteer Examiners and coordinate giving upgrade exams in each of the 13 FCC defined regions.

July 21, 1989 marks the 5th anniversary of the ARRL Volunteer Examiner Coordinator. Department manager Bart Jahnke, KB9NM says that to date, the ARRL VEC has processed 9600 Volunteer Exam (VE) sessions. Averaging between 180 and 220 sessions per month, they expect to hit the 10,000 session mark around the first of October.

FIRST 20 ON 40

The DXCC Desk is happy to announce the recipients of the first twenty certificates for the newly created 40 Meter DXCC Award. Listed below is the certificate number, callsign and total number of DXCC countries confirmed for each of the twenty. Duplicate certificate numbers have been assigned when two or more amateurs have been credited with the same country totals.

NARTE CERTIFICATION AVAILABLE TO HAMS

The National Association of Radio and Telecommunications Engineers (NARTE) is granting its entry-level Class IV certificate to Advanced and Extra Class amateurs. The NARTE program covers broadcasting as well as commercial aspects of satellite, microwave, and land mobile communications and certification provides a means whereby amateurs may enter the commercial field.

If you are interested in adding yourself to the pool of technical personnel for industry, contact NARTE at PO Box 15029, Salem, OR 97309.

NEW PREFIXES IN THE PACIFIC

The ITU has allocated the call sign prefix V6 to the Federated States of Micronesia (formerly one of the users of the KC6 prefix). Amateur stations will use call signs V63AA through V63ZZ.

The call sign prefix V7 has been allocated to the Republic of the Marshall Islands (formerly KX6). Amateur stations will use call signs V73AA through V73ZZ. (Per the US Dept. of the Interior 7-12-89)

MACC SAYS "YES" TO ARRL REPEATER DATA BASE

The Mid America Coordination Council, Inc, (MACC) announced that it will participate in the ARRL's National Coordinator's Data Base.

The announcement followed assurances to Ken Enenbach, (KC0WX) President of MACC, by the ARRL Executive Committee that satisfied some concerns regarding security that MACC had had.

The Mid America Coordination Council member states include Colorado, Illinois, Iowa, Kansas, Minnesota, Missouri, Nebraska, Oklahoma, South Dakota and Wisconsin making MACC the largest regional organization in Amateur Radio Coordination.

FCC FINES AMATEURS FOR UNAUTHORIZED RADIO ACTIVITY

On June 8, an FCC engineer monitored a radio station in operating on 7.415 KHz from the residence of Herbert Meyers, K2LPK in Massapequa, NY. Neal Newman, KA2CAF was assisting in the station's operation.

The unauthorized broadcast station calling itself "World Wide National Public Radio" was playing music, signing with the call letters "WNPR".

Newman and Meyers were fined $750 for unlicensed radio operation which is a violation of Section 301 of the Communications Act. Unlicensed radio operators may be subject to fines of up to $100,000 or one year in prison or both.

> FP5HL St. Pierre et Miquelon 12/88
the qth is in issue 109 of the "go" list, anyone have this copy?
> 9J2AL 1/89
the qth is in issue 108 of the "go" list, anyone have that copy?

> I'd also be interested in hearing about sources for QSL info. lists that
> seem to be available (yes, I am closing in on DXCC, finally).

Bruce, I suggest the W6GO/K6HHD list, send for a sample at POB 700, Rio
Linda, CA 95673. This is about the best source, but as you can
see, you essentially have to have a subscription to get "all" the
info...however, a few qsl managers out of there will save you a lot
of money and frustration. Of course, a fairly recent callbook is
nice to have as well!

the magazines and dx bulletins are also good sources, but the info
there is usually in the go list. I would suggest a good dx
bulletin if you are chasing dxcc, as they will keep you posted on
what is happening, as well as usually listing contest operations in
dx locations, qsl routes, etc. if you are "nearing" dxcc, then the
QRZ DX paper is, in my opinion, one of the best...it lists just
about every low end operation. If you are nearing 200 or so, then
the DX BUlletin is great, as they only focus on the "rarer"
countries, although rare is a strange definition....alaska and
hawaii are rare if you dont' have them...and try to find nevada or
delaware for was!

good luck.

I have two degrees in electrical engineering and a job with a major communications R&D company. Neither degree nor my job required me to learn the Morse code. So much for "educational breadth" and the code.

Your reasoning could be used to justify ANY requirement for anything, no matter how irrelevant. The line has to be drawn somewhere. Even college graduation requirements are continually updated to reflect changing times.

> large Stromboli from Stuft's for the following reasons:
>
> a) It is not a REGULAR transaction. If I use an autopatch every
----
The REGULARITY does not have to be on the repeater to constitute a REGULAR
business. If the pizza parlor REGULARLY conducts business selling pizza, then
you are facilitating that REGULAR business when you order ONE pizza just ONCE
by whatever means you choose. The FCC rules just say such a facilitation is
not to be done via Amateur Radio (whether by phone patch or otherwise).

> night of the week to order a pizza, then it becomes a regular
> transaction. The reason for prohibiting this is that, if I know
> in advance that I'll be transacting business on a regular basis,
> I should subscribe to another private radio service, which is targeted

> transaction consists of a solicitation, an inquiry, an offer,
------------ ------- -----
> a bid, and an agreement, minimally. Unless Stuft's advertises
--- --------- ==========
> on the repeater, the autopatch does not consititute a business
===============
Wrong line of logic here. You are assuming that to constitute business on

the repeater (or on radio), then ALL the elements of the business must ALL be done via the repeater for THAT transaction. ***WRONG***

You are facilitating the regular business by simply having ONE ELEMENT of a transaction on the repeater, and that facilitation is prohibited by FCC rules (and you know which one I mean).

> transaction. This is why, for example, swap nets are allowed to
--- ---------------------
> exist; the bid and agreement process are transacted elsewhere.

They are allowed because the FCC has considered the rule allowing transmission of informational messages concerning amateur radio to override the rule against business transactions when such messages simply provide information about the availability of amateur equipment for sale, or desires of individual hams for buying amateur equipment. Since 2 parties to a transaction do not YET exist, the FCC sees it as not significantly business.

I can announce that I am selling my Kenwood TM-3530 ham transceiver for $300 but I CANNOT announce that I am selling my Nikon FM-2 camera, over a swap net. YOUR argument applies equally to both since you are basing it on the fact that only part of the transaction occurs. This is not the basis used by the FCC.

> 4. If you want to play lawyer, go take some law courses.

What courses have YOU taken?

I have not taken any, but one does not need to take courses to understand law. Lawyers have the resposibility to advise and represent people. The statements I make here do not constitute legal advice (because I am stating this to be so right now) but do constitute informing others about what my interpretation/opinion of the matter happens to be.

Also, do NOT interpret me as one who wants to prohibit people from ordering a pizza on the air. I would like to see some circumstances where I could do so. On the other hand, I know the rules prohibit it NOW. I would like to see them changed. If I hear someone ordering a pizza by ham radio and it does NOT affect me, I probably will ignore it. If they order it over MY repeater/patch then I **WILL** dump the patch and/or repeater, since it is in effect **ME** doing the violation of the rules, and I will NOT violate the rules as I see them to be.

The reason I have to respond to these postings is I can't stand to see flawed logic go unchallenged.

Message-ID: <17364@bellcore.bellcore.com>
Source record: 17596

KF0CA: Any chemists out there have a sure-fire process [for silver plating]?

The standard process involves a cyanide electrolyte, usually potassium cyanide. Often silver cyanide is also used (you still need the potassium cyanide to make the silver cyanide dissolve). I've seen recipes that include several other chemicals in small amounts, but I don't remember offhand what they were except for small amounts of potassium hydroxide or carbonate as an alkaline buffer to inhibit the formation of hydrogen cyanide (HCN) gas.

My next door neighbor Ray, K2QWG, has silver plated electronic parts (screws, tank coils, tube sockets, etc) with cyanide for some time with excellent results. If you're interested I could get details on solution concentrations and current densities; I do recall that low currents should be used to avoid "burning" the piece (plating the silver as a black precipitate).

And just to state the obvious: CYANIDES ARE EXTREMELY TOXIC. If you're able to get this stuff (it's become harder to obtain with all the cyanide poisoning scares of the past few years) use the following safety precautions:

1. Work outdoors, away from children, pets, etc. If HCN gas forms, you don't want it to accumulate!

2. Wear gloves and goggles. Cyanide can be absorbed through the skin.

3. Do NOT just flush the solution down the drain when you're done. Pour it SLOWLY into a partially-full jug of sodium hypochlorite solution (liquid bleach, e.g., Clorox). This will oxidize the cyanide ion to cyanate, which is far less toxic. (The reason for doing it slowly is that the reaction is quite exothermic, i.e., it generates heat. I once helped Ray dispose of a solution containing no more than a gram or two of cyanide into a half gallon of bleach, and the jug became noticeably warm to the touch.)

4. Keep cyanide compounds in tightly sealed containers, and keep the containers in a locked cabinet. Potassium cyanide is quite hygroscopic, i.e., it grabs water from the air. Keep any and all acids well away from cyanides; acids decompose them, liberating highly toxic hydrogen cyanide gas.

5. If you smell hydrogen cyanide while plating, get away! HCN is reported to smell like bitter almonds. The time I smelled it, it had a rather sharp, acrid odor (perhaps due to contamination) but I wasn't willing to stick around to make a more precise determination. What makes hydrogen cyanide dangerous is not its toxicity per se (hydrogen sulfide is actually about equally toxic) but its ability to knock you out relatively quickly. For

this reason it would be a very good idea to have someone nearby just in case you get into trouble.

There are, unfortunately, no real substitutes for cyanides in silver plating. Attempts have been made to use photographic hypo (sodium thiosulfate) but it just doesn't seem to give the same results.

From: fiesta@cbnewsi.ATT.COM
Message-ID: <533@cbnewsi.ATT.COM>
Source record: 17599
Cross-posted to: sci.electronics,rec.ham-radio

I've come across a used Tektronix 432 scope for sale. Problem is, I have no idea what these things are worth (used). It seems to be in good condition, and apparently hasn't been used very hard. Has anyone seen/bought one of these at a ham-swap or surplus place lately?

I've been using a Heathkit 10-102 scope that I built 20 years ago without trouble. Performance isn't great, but when it breaks I always know how to fix it. In comparison, I expect that the repair (and finding parts) for the Tek scope to be more difficult. I would appreciate any experiences along these lines that you may have to share.

Thanks,

Eric Beck

A new world DX record for 5.7 GHz at 613 miles has been set by N6CA &
N6SNA in california and XE2GXQ/N6XQ in Baja Mexico. Signals were 30dB
out of the noise. 4ft dishes were used, with 4 watts and a 1.5dB noise figure
receiver. The same path was worked on 3.4 GHz using 1.5 watts and 2.5dB
nf receivers. Talk back on 144 MHz and 1296 MHz was so poor that a HF
liason link via KH6 was used. 3.3, 5.7 and 10 GHz systems have been
shipped to KH6 by N6CA. California - Hawaii on 10 GHz? Shouldn't be
long now....

> provides all the information, its just the software thats deficient?

A couple of years ago, VE3EC and I developed a little box called a Scanalyser. The purpose was to permit tuning of a SSTV signal on the low bands. It took the audio from your rig and generated a video display of the frequencies present (a histogram). There was syfficient space left in the EPROM to add code to display RTTY frequencies and packet too, as well as a software UART to do the reception of Baudot RTTY and display it on the screen. We built a number of them but then we got cloned so the orders stopped. Anyway, the unit uses a single chip micro and a few supporting components and a display chip. Works great.

Bill extended the idea to his current project: a WEFAX only decoder. The unit uses about 6 chips and sends the decoded WEFAX to a PC on a standard 19.2KBaud serial link. The WEFAX is quantized to 15 levels (1-15, 4 bits) with 0 being the SYNC level. 2 pixels are packed per byte and sent to the host. (The PC software uses an interrupt driven serial communications handler and that means you can go away and do the housekeeping without losing data! On screen input buffer bar chart, etc.)

The PC can display the data to enable framing and previewing (1 bit only- black or white- just for monitoring) but the gray-scale data can be stored in a file.

Bill's idea is to generate a TIFF file and then a bunch of TIFF drivers for various devices (EPSON, EGA, HERC etc.) and of course, if you have Pagemaker or something that can read TIFF on the PC you could read it directly.

The files can be transported to a Mac and printed out under Pagemaker on a laser printer- look great right now! Bill will be publishing the design and distributing the software later. I will keep the net informed of his progress.

By the way, if you are interested in a Scanalyser, assembled & tested, or pc boards and EPROM software, leave a message for me here.

2037. mods for synthesized stereos (akai AAR22,32)

Newsgroup: rec.ham-radio
Date: 1989-08-09 15:33:14 UTC
From: rfc@briar.philips.com
Message-ID: <61192@philabs.Philips.Com>
Source record: 17603
Cross-posted to: rec.ham-radio,rec.audio,sci.electronics

As you would expect, just like the ham radio synthesized trasncievers, synthesized stereo recievers can have some simple modifications done. (I assume that you're handy with a soldering iron, and knowledgable of CMOS digital circuitry. Like avoiding static discharge into the chips, etc!)

I have an Akai AAR32 stereo reciever, which is a synthesized tuner for AM and FM. In the service manual (which you should always get before you consider doing anything inside), it describes two other recievers, the AAR22 and 42. The 42 has all the features (random tuning and 10 presets) and the 22 has the least features (no random, and 6 presets). My set, the 32, has no random and 8 presets. All these sets use the same comtroller chips, so all you need to do to get all the features is add some push-buttons. I put mine on the back, as I couldn't figure out how to add them to the front without it looking ugly!

What to do: for the AAR32:
first, get the service manual!
turn off the power!
then:
-Do not remove any screws that mount the pc boards to the chassis, or you may end up fighting with buzz noises (comes from the digital stuff).
-get some momentary contact switches (I used a push-button, and a momentary contact center off double throw toggle switch), use normally open.
-find a good place to locate the new switches (I removed the AM antenna bracket, and mounted the switches in that hole.)
-plan a good route for the wiring of the switches (like avoiding going near audio signal lines, especially phono inputs, and AM and FM inputs)
(shielded multiple cable would be wise)
-find on the controller board J5 and J9
-wire the random push-button across pins 1 and 6 of J5 (what I did was solder the new wires to the ends of cables going to J5 and J9 on the controller board)
-wire the common of the momentary contact toggle to pin 6 of J9
-wire the "0" side of the momentary toggle to pin 3 of J9
-wire the "9" side to pin 4 of J9
-reconnect the cables
-inspect your work, make sure you're not shorting out something, etc.

connect the power, AM and FM antennas, and speakers or headphones. Turn on the power. You should hear the station you were listening to last. Hit one of the old presets, and you should get whatever you had programmed for that preset. Ok, so that seems to work, right? Tune another station in random access style like this: Press the random button. The tuner will mute and the frequency display's first digit will flash, and the other digits will be 0s. Type in the freq of the station with the preset buttons. The last digit is always a 0, don't

type it in. The tuner should take a second to find that station, and
then you should hear it. If you type a not valid frequency, like 144.7
Mhz, the controller won't try to tune it, but will make the freq
display flash. Hit "random" again, and type a valid freq. Then you'll
get that station. You'll find that the controller puts the reciever in
"auto scan" mode if you make this error. Hit "manu scan" if you want.
You can program the 9 and 0 buttons as presets, like the other presets.

For the AAR22 (which I did not try, I don't have one. The following I got by
looking at the diagrams in the service manual):

-do the steps for the 32 above, except don't do the steps wiring the switches
to J5 and J9, as these are different on this set.
-for the "7" button: wire pins 3 and 8 of J6
"8" pins 4 and 8 of J6
"9" pins 1 and 9 of J6
"0" pins 2 and 9 of J6
"random" pins 4 and 9 of J6

Finding a place to mount these new buttons may be a problem. Don't forget
about static discharge if you decide to make a wired remote box. You'd be
wiring direct to CMOS circuitry, which is easily ruined by static from carpets
in winter.

Disclaimer: Proceed at your own risk! So be careful when you do this, like
avoiding static (use grounded soldering irons), shorts, solder spashes, etc

Message-ID: <7305@microsoft.UUCP>
Source record: 17624

last night i compared the KLM 18cx and 40cx 70cm
satellite antennas on OSCAR-13. here are my results.

using a ICOM 475H, with ICOM AG35 preamp, on mode J
downlink, with the *18cx*:

received signals from good stations: 0x3 s meter reading.
audio *not* very understandable.

with the *40cx*:

received signals from good stations: 5x8 s meter reading.
audio *very* understandable.

as for uplinking on mode B, there wasnt too much difference;
most stations were giving me 5x5 reports.

NOTE: i asked a couple of the louder stations on the bird
what equipment they were using; each of these *loud*
stations said that they were using 2 KLM 22cxs for
2m and 2 KLM 40cxs for 70cm!!!! each using around 50watts
power up on 70cm.

recommendations: dont by the 18cx!!!! go w/ the 40cx; and
get pairs if you can afford it!.

I don't think so. I have my old schematic around somewhere but I seem to
remember that the VCOs are all banded and that the CPU only knows about
2 MHz wide bands. Also I think band info is hard coded into the display
drivers.
Trade it off and get a 725 (:>)

I've been considering the R5 also. In the ads, it states something about a "solid state matching network". What exactly is this?

Is there a built in tuner? Does it require a controller/power?

> > houdi!nd2k

My father and I both purchased R4's about a year ago, he (WR4A)
upgraded his to an R5. I have built several Cushcraft kits and
this one is by far the best for fit and finish. I put the R4
together in @20 min. It seems to be reasonably flat across the
entire band(s). I have had excellent reports considering I use
a TS-830S barefoot and the R4 does not clear the trees. I have
worked JAs, ZLs, and VKs with no problem from here in Alabama.
For the simplicity of no radials, short height, ect. I truly
love this 'tenna. My father's R5 works just like the R4 only
you get an extra band... His 17m full wave loop is the only
17m antenna (out of 4) that has a better S-reading on the same
signal than the R5. Hope this helps.......

I'll second Barry's motion and add some more detail. Cool-Amp is about the
neatest stuff since sliced bread for silver plating copper and brass. This
stuff is marketed to be used in silver plating heavy buss bars in electrical
service. As such, it can normally be found at electrical supply
companies.

This stuff lasts literally forever. I've had a pound for almost 15 years.
The jar is still half full, even after giving some away. This stuff is
also very good for touching up silver plate on silverware and jewelry.

2045. Converting a Fluke 75 DVM into a model 77

Newsgroup: rec.ham-radio
Date: 1989-08-09 20:38:25 UTC
From: karn@jupiter.bellcore.com
Message-ID: <17373@bellcore.bellcore.com>
Source record: 17615
Cross-posted to: rec.ham-radio,sci.electronics

I recently purchased a Fluke model 75 multimeter. This is a middle-of-the-line model in their autoranging handheld DVM series. It differs from the top-of-the line model 77 by being about $30-$40 cheaper and by lacking the model 77's "touch hold" feature that allows the meter to latch a measurement after you remove the test probes. (The model 77 is also specified to have slightly better accuracy).

A friend in the lab here has a model 77, so on a hunch I decided to compare the PC layouts. Sure enough, there was one jumper that occupied different positions in the two models. When I moved the jumper on my model 75, I discovered to my delight that it had gained the touch-hold feature of the model 77!

The change is quite easy to make.

1. Turn the unit over and remove the four screws holding the case together. Remove the case top and set it aside.

2. Remove the 15A fuse at the bottom of the PC board to reveal a single screw that holds the PC board to the bottom of the case. Remove the screw and take out the PC board.

3. Holding the PC board with the display at the top, examine the components just above the function switch. Just to the right of the calibration pot is a resistor, and just to the right of that is what looks like another resister but is actually a jumper (it has the color code of a 0-ohm resistor!) In the model 75, the jumper occupies the second and third holes of a set of three holes, counting from the left. Unsolder one end of the jumper from the third hole and move it to the first hole.

4. Reassemble the unit, taking care to ensure that the function switch knob shaft position lines up with the switch on the PC board before screwing the cover back on.

To enable the touch-hold feature, hold down the button in the center of the function switch as you turn the meter on. To disable touch-hold, turn the meter off momentarily. (The instruction manual provided with the model 75 also covers the 77).

> real problems with no-code. I've weighed them, and they come up short.
> Given that, I feel compelled to point out the problems every time
> someone advances the weak arguments for no-code.

I'd really love to debate some real issues and arguments on the matter.
I just hate it when someone comes along and repeats the same old stuffy
tripe I've hear before, and does not yet convince me that I am wrong.

I'll hear any argument once. If I feel I have rebutted it, I don't want
to hear it again unless it has been improved upon. If it is not improved,
and is public, I will just repeat the rebuttal. If it is private I may
just ignore it. If it is improved, I will have to think about it. I cannot
say for certain that no argument will reverse my position, but to date, many
have fallen down too quickly (although many people don't agree with me).

I've tried to gather up some of the arguments used against a codeless license.
So far, most of them fall under "incorrect premise" such as the argument that
a CW is required by international agreements. The fact in that case is that
the agreement does not apply to licensing a ham with privileges above 50 Mhz.

Other arguments are much harder to deal with. Even so, many of those who put
forth these arguments don't back them up. They just have an opinion and say
what it is, such as "no code will let in the riff-raff".

Still other arguments don't even make a point. Take for instance the argument
used a lot "morse code is a tradition in amateur radio". That argument by
itself makes not point. There needs to be a showing of WHY a codeless license
is in conflict with morse code being a tradition in ham radio. I don't believe
that it is in conflict, but I certainly would say it is in conflict with
someone trying to have CW banned altogether. But a codeless license is the
issue at hand.

Could you post some really GOOD arguments to explain why and how a codeless
license is not good for amateur radio and/or is in direct conflict with the
goals of amateur radio (as per 97.1) and the public in general (such as why
someone who does not want to learn code should not be a participant).

I look forward to some better arguments than the kind that I have heard on
here so far.

>From: jay@splut.UUCP
> Absolutely right. If we fix the public's lack of knowledge about ham
> radio, the rest of the problems above will take care of themselves.
> No-code won't fix the problem, and will introduce more problems.

If they have knowledge, they still might come to a different conclusion
than we might want. They might learn all about the code debate. If they
are not interesting in learning code, they will know they can't get into
ham radio, and will petition the FCC to move several of ham radio's VHF/UHF
bands over to a new experimental service, which won't have a code requirement.

I am interested in purchasing books on radio and early works by and about researchers and experimenters in electrical theory (De Forest, Fessenden, Fleming, Heaviside, Hertz, Marconi, Maxwell, etc. etc. etc.). Funds are limited and I usually have to constrain my efforts to used bookstores. Unfortunately, I can only find and scour a limited number of secondhand bookstores. I am hoping I can prevail upon YOU to let me know about your bookstores, or other sources of used books. Then I can send a letter and ask them to check their stock, or post an ad or whatever. Please send me your local used bookstore's address (preferably via electronic mail).

If you're feeling very generous you might print this off & hand it to a local bookdealer or post it on those little bulletin boards by the front door. I'm very interested in finding addresses outside the United States, especially Great Britain, and I am interested in books written in languages other than English (if I can figure out what they are).

Of course I'll be happy to share whatever information I acquire through the kindness of the Net. (I am still looking for the schematics some people requested after my last plea.)

Source record: 17620

Hi. The main reason your counter won't affect the rest of your 820S is that the counter is just that - a frequency counter - and not a digital VFO like many of the newer radios.

I would begin with carefully unplugging the DG1 counter and cables, clean the edge connectors with a soft eraser. If the problem persists then you have two likely problems to examine.

1. Insufficient input to the counter circuit (X54-1160-00)
This may be caused by a defect in the 7.83 Mhz mixer circuit With an RF VTVM you should have about 0.1 v at TP6 on IF Unit X48-1150-00
- otherwise adjust TC1 in IF unit to 0.1 v
With an RF VTVM you should have 0.12 to 0.2 v at TP2 in the counter-mixer unit (X48-1150-00). Otherwise, adjust T1 and T2 in the c-m unit to obtain a peak of 0.12 to 0.2 v.

2. A defective gate and reset latch pulse generator circuit in the counter circuit X54-1160-00 Check for defective IC3, IC4 or IC5 .

I hope this helps. I have a TS820S too, and this comes from the service manual.

philosophy of Ma Bell.

>> incorrect, which made it invalid at the time it was written.
> ---------- -------------------
> I assume you are a Judge

1. The writing in question is not a law; it is an ARRL guideline.
2. I am arguing that it was invalid, not formally invalidating it. I assumed
that was obvious.

>> a) It is not a REGULAR transaction. If I use an autopatch every
> -------------------
>The REGULARITY does not have to be on the repeater to constitute a REGULAR
>business.

Why? Clearly, there is good reason to prohibit regular transactions, since
cellular exists for such things. Also, if one uses a wider definition of
business to include noncommercial affairs, then all nonemergency autopatches
are illegal per your logic.

>You are facilitating the regular business by simply having ONE ELEMENT of
>a transaction on the repeater, and that facilitation is prohibited by FCC
>rules (and you know which one I mean).

Oh really? So if I happen to mention that we should all meet at Stuft's,
since they're having a special on Sicilian pizza, this is a violation?

>They are allowed because the FCC has considered the rule allowing transmission
>of informational messages concerning amateur radio to override the rule against
>business transactions when such messages simply provide information about the
>availability of amateur equipment for sale, or desires of individual hams for
>buying amateur equipment. Since 2 parties to a transaction do not YET exist,
>the FCC sees it as not significantly business.

Actually, I suspect that swap nets simply exist because hams wanted it that
way, and the FCC really couldn't find any harm in it, rather than in any
specific legal niche

>What courses have YOU taken?

Procedures and Contract Law. On the whole, an interesting departure from engineering.

>I have not taken any, but one does not need to take courses to understand
>law. Lawyers have the resposibility to advise and represent people. The
>statements I make here do not constitute legal advice (because I am stating
>this to be so right now) but do constitute informing others about what my
>interpretation/opinion of the matter happens to be.

As do mine. My gripe here is that 1) The ARRL's wishes are being taken as gospel and mistaken as FCC rules, and 2) The result is an overly tight interpretation of the law, which may result in a formal tightening of the law in the future. No, I'm not a lawyer (I don't even play one on TV). And no, none of what I've written constitutes legal advice; it does constitute an argument as to why the ARRL's policy is wrong.

Let's face it folks, there's a ton of fuzziness when iterpreting exactly what is meant by "regular business communications". The safe thing to do is to follow a tight interpretation, as the ARRL specifies. However, the natural result of this will be eventual restrictions on non - emergency autopatches, since this was the policy established by the user community.

>The reason I have to respond to these postings is I can't stand to see

HR AMSAT NEWS SERVICE BULLETIN 203.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 22, 1989
TO ALL RADIO AMATEURS BT

Digital Store-and-Forward Capability Now Available from WB6GFJ Via UO-11

A new facet in the Amateur Radio Satellite Program was commenced by Ross Forbes (WB6GFJ) President of Project OSCAR on July 7,1989 when WB6GFJ successfully commanded the UOSAT-OSCAR-11 satellite to change beacon frequencies from 145.825 MHz to 435.025 MHz. This simple act of commanding UO-11 to change beacon frequencies allowed Ross to upload messages to the Digital Communications Experiment (DCE) for retrival later by anyone of a number of DCE Gateway stations located around the world. These Gateway stations are located in such diverse places as Anarctica (ZL5BA), Australia (VK5AGR), Pakistan (AP2UP), New Zealand (ZL1AOX), South Africa (ZS6SAT) as well as England (GB2UP), and West Germany (DB2OS). WB6GFJ joins this team of stations from around the world as an active DCE Gateway station for the U.S.A. The DCE is the University of Surrey's "forerunner" to the concept now embodied by the AMSAT MICROSAT/PACSAT's which are currently under construction and scheduled for launch later this year. Now, through the help of the N6IIU BBS located at the headquarters of the Palo Alto, CA Chapter of The American Red Cross, all radio amateurs are invited to use this new "digital-store-and-for-ward" capability which the WB6GFJ Gateway provides. Radio amateurs can now send message "traffic" to any country which has a DCE Gateway. Through an automated link, you can leave a message on the N6IIU BBS with the "SUBJECT" titled "DCE MSG" and this will alert the system operator of N6IIU that this is message "traffic" which is to be forwarded to WB6GFJ for the DCE on UO-11. In order to use the DCE to send a message to a station in any of the above mentioned countries, you MUST know a local packet radio BBS in which that station has access to. For example, let's suppose WD0HHU wishes to send a message to G3RUH via the UO-11 DCE. First, WD0HHU would check into his local BBS, (in Denver, CO this is W0LJF) and he would specify the following routing:

SP WB6GJF @N6IIU SUBJECT: DCE MSG

This causes the message that WD0HHU has uploaded to be routed to N6IIU where it will wait in a "mailbox" until forwarded to WB6GFJ. Then in the FIRST line

of your message you must also include additional routing information. Again continuing with the above example, WD0HHU has to know that the local packet BBS for G3RUH is GB7SV so he would have in the FIRST line of his message the following routing information:

SP G3RUH @ GB7SV < WD0HHU
("Hi Jim"....
text would follow here...)

After the routing information on the first line, you can then proceed with your message. Please keep messages to 1K bytes or less. Once WB6GFJ receives this message "traffic," it will be put into a special file where it will wait until the next pass of UO-11 and then it will be uploaded with all the other UO-11 DCE messages. Going back to the example above, when UO-11 is over GB2UP (University of Surrey's DCE station), the WD0HHU's message to G3RUH will be downloaded and then forwarded to GB7SV packet radio BBS where it will stay until G3RUH then picks up his "mail." This procedure likewise works in the reverse direction. All are welcome to use this packet radio experiment which WB6GFJ has set up at his QTH. To repeat, you must first get your message to WB6GFJ @N6IIU and then you must know a local packet radio BBS where the recipient of the message can pick it his "mail." Welcome the the world of "digital-store-and-forward" on the UO-11 DCE.

N0DSH Builds And Donates High Fidelity MICROSAT Models For AMSAT-NA

Long time OSCAR enthusiast and AMSAT volunteer Monty Munro (N0DSH) has just completed building eleven high fidelity, full-scale models of the AMSAT MICROSAT spacecraft. Monty who lives in Canon City, CO has donated over 320 man-hours of his labor to build this models. Each of the AMSAT-NA Regional Coordinators will be receiving one of these models soon according to AMSAT-NA VP of Field Operations, Jack Crabtree (AA0P). The expressed purpose of these models is for use by AMSAT-NA Area Coordinators to display at hamfests, club meetings, and other events which help to promote the Amateur Radio Satellite Program. At a recent hamfest in which AA0P attended, he displayed one of N0DSH's models; many amateurs were astonished at the fact that the MICROSAT model was full-scale! Also, many were intrigued by the antennas on the models which are made of the exact same "measuring tape" steel that the "real" MICROSATs use. Area Coordinators who would like to acquire a MICROSAT model for use at a hamfest or club meeting should contact their AMSAT-NA Regional Coordinator. AMSAT-NA wishes to express its sincere appreciation to Monty for his effort in building these excellent models.

RSGB/AMSAT-UK DATASPACE '89 Brings Worldwide AMSAT Enthusiasts Together

On Wednesday of this week OSCAR satellite and packet radio enthusiasts from all over Europe and the world will be converging on the University of Surrey for this year's combined RSGB Data Symposium and AMSAT-UK Colloquium known as DATASPACE '89. Starting off on Thursday, July 27th, this event will cover for the next four days many aspects of digital communications from HF packet to OSCAR satellites. Also, an extra day was added so that a colloquium on "Satellites-in-Education" could be included. Representing AMSAT-NA this year at DATASPACE '89 is Doug Loughmiller (KO5I). Other AMSAT-NA "stalwarts" who will be there which include N4HY, W2RS, NK6K, and N8IWJ. From BRAMSAT, Dr. Junior de Castro (PY2BJO) will also be present. Look for GB2SAT on HF and GB0AUK on AO-13 from the UoS. With SIX amateur radio satellites to be launched later this year, there will be plenty of interest in this colloquium.

AMSAT Short Bursts

Andy McAllister (WA5ZIB) will be conducting the following planned ZRO sessions and if you wish to participate, please take note of the following times:

Saturday July 29, 1989 at 04:20 UTC
Saturday August 12, 1989 at 20:20 UTC

All transmissions from the control station use CW at 10 words-per-minute. Please avoid transmitting near the 145.840 MHz downlink frequency during ZRO Tests. The above dates and times have been carefully chosen for best coverage and squint angles. Any changes will be announced as soon as possible. ZRO brochures are still available from WA5ZIB for an S.A.S.E. with one unit of postage. If you wish to inquire about receiving your ZRO Test brochure or certificate, write to: Andy McAllister, WA5ZIB, 14714 Knightsway Dr., Houston, TX 77083. Good luck!

Through the efforts of Sumio Nakane (JH3BJN), AMSAT-NA has received the following operating schedule for FUJI-OSCAR-12 for the next several months:

DATE MODE OPERATING PERIOD

07/29/89 JD 06:43 UTC until 14:55 UTC

PLEASE NOTE: NO FO-12 OPERATION FROM AUG. 1ST
TO AUG. 15TH DUE TO SOLAR ECLIPSES

08/16/89 JA 02:40 UTC until 10:52 UTC
08/19/89 JA 02:00 UTC until 10:12 UTC
08/25/89 JD 00:39 UTC until 08:51 UTC
08/27/89 JD 00:53 UTC until 09:04 UTC
09/02/89 JA 22:37 UTC until 06:49 UTC on 09/03/89
09/05/89 JA 21:57 UTC until 06:00 UTC on 09/06/89
09/08/89 JD 19:15 UTC until 03:27 UTC on 09/09/89
09/13/89 JA 18:48 UTC until 03:00 UTC on 09/14/89

There is a AMSAT 17M Net which is convened every Sunday evening beginning at 23:00 UTC on a frequency of 18.155 MHz. Acting as Net Control Stations (NCS) are KO5I and N4QQ. This net provides another opportunity for those who cannot listen to the AMSAT nets on Sunday afternoon to still find out what is happening in the world of amateur radio satellites. So join KO5I and N4QQ on Sunday evenings for this new AMSAT HF net.

At the present time, the launch of the MICROSATs is scheduled for November 10, 1989. Since this falls within two days of the "normally" scheduled AMSAT-NA Space Symposium, AMSAT-NA officials have decided to change the date of this annual AMSAT event to the weekend of November 3rd, 4th, and 5th. If you would like to obtain more detailed information about the AMSAT-NA Space Symposium, you will find a special "menu" option on the AMSAT-NA BBS which will give all the pertinent details about this annual event. The AMSAT-NA BBS can be reached at (314) 447-3003; 300/1200/2400 baud modem speeds are supported.

Courtney Duncan (N5BF), Manager of the AMSAT Operations Net, has issued the following schedule for the next several weeks for the times and frequencies of the OPS Net. These nets on AO-13 are designed to discuss the many happenings in the world of Amateur Radio Satellites. If you have any comments or suggestions to pass along to N5BF, you can leave them to COURTNEY DUNCAN on the AMSAT-NA BBS at (314) 447-3003.

WB8ELK ATV BALLOON FLIGHT

HR AMSAT NEWS SERVICE BULLETIN 210.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 29, 1989
TO ALL RADIO AMATEURS BT

WB8ELK ATV Balloon Experiment Yields Spectacurlar Pictures

Renowned amateur radio balloon "experimentalist" Bill Brown (WB8ELK) reports that his most ambitious effort in carrying Amateur Television (ATV) fast scan equipment aloft by a weather balloon was a complete success. On Sunday, July 23rd at 1:47 P.M. EDT Bill launched a five pound payload that included a video camera, an onboard computer, a one-watt output ATV transmitter, and a 40 mW CW identification beacon on 2M. The launch point was from the Neil Armstrong Air & Space Museum in Wapakoneta, OH and was part of ceremonies commemorating the 20th anniversary of the first moonwalk. Using a particularly large balloon capable of lifting five pounds easily, Bill reported that not only was he able achieve a "clean" launch but it felt like for a few moments that the 7 ft diameter balloon was about to take him along for the ride! Based on the data from the altimeter, the balloon had a climb rate of 1000 ft/min. It was visable to the naked eye up to an altitude of 20,000 ft. The final height attained by the balloon after two hours of flight was estimated to be around 120,000 ft! Throughout the the flight ATV'ers were thrilled by the spectacular pictures which were being sent back to earth. The pictures showed details of such things as towns, cornfields, clouds, and the beautiful Ohio countryside. Excellent picture quality reports were received by amateurs in 15 states and Canada. Besides the beautiful pictures, superimposed on the ATV picture was two lines of telemetry generated from the onboard computer. The telemetry included station identification, altitude, inside and outside air temperature, bus voltage, and a elapse-mission-time counter. During the ascent, the inside temperature stayed a "warm" +72 degrees F while the outside temperature was an extremely "frigid" -71 degrees F! When the balloon finally burst, it took over a half an hour for the payload to reach the ground. Bill said that the parachute did not start to slow its rapid decent until around 50,000 ft! Bill reported that the ATV pictures were just as facinating on the

way down as they were on the way up! On the way down, however, it was speculated that the onboard computer stopped working around 36,000 ft and the pictures started to degraded in quality because the lens fogged over after the payload passed through a cloud. The payload landed safely in a cornfield about eight miles south-west of Delphos, OH. Bill, with his vast experience in recovering his balloon experiments, had a team of six "chase" vehicles following the balloon around the Ohio countryside; Bill was also using his own computer program to predict where it was going to land using the same winds aloft data that the airliners use. The recovery team tracked the balloon, using DF techniques, to a farmer's cornfield but it was still not that easy to find it. Compounding the recovery effort was the fact that the balloon had landed in the middle of a cornfield which necessitated the team having to walk a mile and a half through very tall cornstalks and fighting off "killer" mosquitoes! Even though the balloon payload was laying on the ground with its parachute beside it and sending out pictures, it was still very difficult to find. Bill said he saw on his ATV monitor, several times, tennis shoes walk by. But finally, Bill said he saw movement, and then a HAPPY FACE! The complete payload was recovered undamaged with the batterys still at full charge. This balloon experiment was particularly well suited for OSCAR satellite users having ATV equipment and a Mode B station. But most important is the factor to be able to receive the pictures during this balloon experiment is the ability to move your antennas in elevation.

For an encore, WB8ELK says that his next balloon launch will be in the first week of October from Champaign-Urbana, ILL area. Bill said his reason for doing the next balloon launch from Illinois was so radio amateurs further west could have a chance to participate in this fun activity. Bill also mentioned that due to the success of this experiment, he is encouraged to add the several new features such as a servo operated mirror so that ATV'ers can see the earth's curavture and a "store-and-forward" voice digitizer to allow a "delayed-action" 2m repeater at 100,000 ft. Also he wants to incorporate a method to control the balloon's altitude so that a controlled decent will be possible; this will make it easier for the recovery team. The ultimate goal Bill wants to try for is a around-the-world balloon flight! AMSAT-NA salutes WB8ELK for his highly innovative work with amateur radio balloon experiments.

WA4ADG/N4HBO Knoxville/Oakridge Balloon Launch Rescheduled for August 5, 1989

Much to the chagrin of Carl Lyster (WA4ADG) and David Fields (N4HBO), their first amateur radio balloon launch had to be scrubbed seconds before lift-off. The culprit in the payload package was a +5V regulator for the CMOS onboard computer which had failed. The failure of this important component manifested itself in the form of "erratic" telemetry. Despite valiant efforts to repair the faulty regulator, it was not possible even after two hours of on-the-spot

effort. Although the telemetry system had been throughly tested for several weeks, "Murphy" decided to strike at this most inopportune moment for WA4ADG and N4HBO. As a famous corollary to "Murphy's Law" states: "The magnitude of the failure is directly proportional to the size of the crowd in attendence." The balloon's approximately 80 cu. ft. of helium was then vented to the atmosphere and the embarrassed ground crew drove home. But determined not to be frustrated again by "Murphy," the radio package is being reworked and the new launch date has been scheduled now for Saturday, August 5, 1989 at 7:30 A.M. EDT. To repeat the important frequencies, listen for the beacon on 144.34 MHz with its output of 250 mW and on 28.866 MHz with its 100 mW output beacon signal, respectively. There will be a change in the ASCII telemetry data on the VHF beacon from what was originally announced two weeks ago; it will now be: 1200 baud, 8 data bits, 1 stop bit, and no parity. This change of parameters was done to provide compatibility for those with AEA PK-232 TNCs. There will be a "pre-launch warm-up" net on a frequency of 7.242 MHz about one hour before lift-off with the NCS being WA3USG. AMSAT wishes Carl and David "good luck" in their next attempt and invite all radio amateurs to join in the fun of this amateur radio balloon experiment from Tennessee.

RUDAK-2 TO FLY ON RS-14 IN '90

HR AMSAT NEWS SERVICE BULLETIN 217.01 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 5, 1989
TO ALL RADIO AMATEURS BT

AMSAT-DL RUDAK-2 Transponder Will Fly On RS-14 "Bird" In Mid-1990

During a meeting between AMSAT-DL officials and a representive of the Soviet amateur radio satellite organization known as ORBITA at the AMSAT-UK/RSGB DATASPACE '89 (the combined space and digital communications symposium held last week at the University of Surrey), a tenative agreement was reached to fly a "follow-on" RUDAK transponder aboard RS-14. Many will remember that the RUDAK experiment which flew on AO-13 (RUDAK is a German acronym that stands for: Regenerating Transponder for Digital Amateur Communications) failed to realize its full potential because a temperature sensitive PROM would not allow the RUDAK computer to "boot-up" properly. Despite many intensive efforts to "work-around" this problem, it was not possible to solve this problem and all attempts were eventually abandoned. But characteristic of the indomitable spirit of the RUDAK group within the AMSAT-DL organization, there will soon be a "new and improved" version of this digital experiment known as RUDAK-2. RUDAK-2 will be part of the new Mode B satellite that will be called RS-14. RS-14 will be flying aboard the Soviet's Geological Survey satellite known as "GEOS," (not to be confused with the U.S. weather satellites known as "GOES") in the now familiar "piggy-back" configuration first seen with RS 10/11. There are several important differences between RUDAK-2 and its predecessor on AO-13: the biggest difference is the AX.25 amateur radio packet protocol will be incorporated into the software -- this means that digipeating will be possible and a limited "mailbox" capability will be present. Also, using the Manchester Encoding technique and Binary PSK modulation, the RUDAK-2 transponder mode will be Mode B. The RUDAK-2 transponder will have two separate receive channels for different baud rates: Channel #1 will be for 1200 baud at 435.100 MHz and Channel #2 will be for 4800 baud at 435.150 MHz. The downlink frequency on 2M will be at 145.990 MHz. The nominal RF output of

the 2M downlink transmitter will be 2 watts; however, it can be commanded by a groundstation to a higher RF output of 12 watts. The delivery of the RUDAK-2 transponder is scheduled to occur on December 15, 1989 so that it can be integrated into RS-14 for a mid-1990 launch. So despite the disapointment of the RUDAK experiment on AO-13, like the legendary "phoenix" that rises again, so does RUDAK.

RS-14 PLANNED TO CARRY MODE B

HR AMSAT NEWS SERVICE BULLETIN 217.02 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 5, 1989
TO ALL RADIO AMATEURS BT

RS-14 Is Currently Under Construction For Planned Launch In Mid-1990

In meetings last week with Leo Labutin (UA3CR) at DATASPACE '89 at the University of Surrey, it was learned that RS-14 is now under contruction and is rapidly moving to completion in order to be ready for a mid-1990 launch. Like RS-10/11, this RS "bird" will be flying in a now familiar "piggy-back" configuration aboard another Soviet satellite known as the Geological Survey satellite called GEOS. RS-14 will be placed into a 1000 km circular orbit at an orbital inclination of 83 degrees. RS-14 satellite will contain a Mode B transponder and the RUDAK-2 transponder along with two beacon transmitters. The planned uplink passband frequency on 70cm will extend from 435.080 to 435.180 MHz. The downlink passband on 2M will start at 145.850 MHz and will extend to 145.950 MHz. As usual, the transponder will be inverting, and the maximum RF output will be 12 watts. The first beacon transmitter will have a downlink on 145.850 and will send telemetry in CW. The second beacon transmitter at 145.990 MHz can either send telementry or it can commanded to be the downlink transmitter for the RUDAK-2. With this new RS-14 satellite under construction by the Soviet amateur radio satellite organization ORBITA, this represents their first effort build a Mode B satellite. Amateurs all over the world will now have another exciting OSCAR to look forward to use next year.

ZRO MODE JL TESTS BEGIN SOON!

HR AMSAT NEWS SERVICE BULLETIN 217.03 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 5, 1989
TO ALL RADIO AMATEURS BT

AO-13 ZRO Test Planned For Mode JL On August 12, 1989

On August 12, 1989 at 21:30 UTC the first AO-13 Mode "JL" ZRO Test will begin. Using a downlink frequency of 435.945 MHz Cliff Buttschardt (W6HDO) will send numeric code groups at power levels beginning at beacon level and progressing downward in 3 dB increments to a level 27 dB below beacon level. The rules of the test are identical with those of the many Mode "B" runs which have taken place via OSCAR 13 this year. This "JL" test will be the first opportunity in

several years for those holding ZRO certificates to get endorsement stickers for Mode "L" reception reports. Send all reports to Andy MacAllister (WA5ZIB) 14714 Knightsway Dr., Houston, Texas 77083, U.S.A. ZRO brochures are still available from WA5ZIB for an S.A.S.E. with one unit of postage. Those participating in the August 12 "JL" test can also monitor the "B" test scheduled for 20:20 UTC that same day. More tests via both Modes "B" and "JL" will be scheduled for late November and December after AO-13 is once again providing NADIR pointing. Tests in July went very well with the exception of a 30 minute delay on the July 29th run due to equipment difficulties at WA5ZIB. During the past month five stations accurately reported level nine reception. Special serial-numbered endorsement stickers are being prepared in recognition of their achievement. The following stations, in order of submission, have attained "Z9" via Mode "B": W7KIV, N8DUY, SM1MUU, DL5DAA and K9NO. Station profiles of the first five on the ZRO "Honor Role" will be reported in a future issue of ASR.

Or you can reach Ralph at the following "land-line" numbers: Home: (515) 961-6406 or Office: (515) 224-8034. On packet-radio you send messages to W0RPK @ W0AK. If you would like to receive an information package about the AMSAT-NA Space Symposium, send a s.a.s.e to Ralph with one unit of postage affixed.

Amateur Satellite Report (ASR) #189 went to the printers last week and will start arriving in mail boxes this week. Because the last ASR received by AMSAT-NA members was in May, this issue of of ASR will be TRIPLE in size. To repeat the schedule for AMSAT-NA publications, the objective is to publish the AMSAT-NA Journal quarterly and the ASR in the intervening months.

Courtney Duncan (N5BF), Manager of the AMSAT Operations Net, has issued the following schedule for the next several weeks for the times and frequencies of the OPS Net. These nets on AO-13 are designed to discuss the many happenings in the world of Amateur Radio Satellites. If you have any comments or suggestions to pass along to N5BF, you can leave them to COURTNEY DUNCAN on the AMSAT-NA BBS at (314) 447-3003.

AMSAT OPERATIONS NET SCHEDULE 1989

Day Date Time Orbit Frequency Local evening, U.S.

Thu 10 Aug 0100 886 435.970 Wednesday

de DB2OS 01May89: *** AO-10 TRANSPONDER SCHEDULE ***
14Jul89 to 01Sep89

Mode-B : from MA 000 to MA 225

O S C A R - 1 3

Date : 14Jun89 until 16Aug89 ! 16Aug89 until 16Nov89
BLON/BLAT : 178.8/-2.2 ! 210/0
Mode-B : MA 000 to MA 110 ! MA 003 to MA 160
Mode-JL : MA 110 to MA 145 ! MA 160 to MA 200
Mode-B : MA 145 to MA 255 ! MA 200 to MA 240
OFF : % ! MA 240 to MA 003
Mode-S : MA 150 to MA 160 ! MA 210 to MA 222

Transponders will be in operation during the whole orbit from June 14 until August 16 due to excellent sun angles and power budgets. However, no perigee operations will occur between August and November due to perigee solar eclipses! The 70cm and 2M omni-directional antennas will be used from MA 230 until MA 30.

I am a SWL and I'm interested in AM reception of broadcasts on the h.f bands.
I've read that some receiver have a synchronous AM detection mode.
I don't know what it is at all and I'm looking for any information about
this subject. Please email to leconte@irisa.fr or answer on the news.
Thanks in advance

Thierry.

2056. Safe silver plating?

Newsgroup: rec.ham-radio

I recall some years ago having procured from a jewler friend some cold-plating liquids that were used for touching up solder joints on jewelry pieces. I recall a gold plating solution that wasn't too expensive, and perhaps there was a silver solution as well? At any rate, someone who's familiar with these might be able to supply details. You just brushed these liquids on, no current required.

In the current-required vein, I have seen advertised in Shotgun News a kit for gold, silver, copper and nickel plating, fairly inexpensive. Uses a brush, a battery and some electrolyte/metal solutions. I'll look around and see if I can locate one of the ads. I do recall a review in one of the shooting magazines that said the kit was pretty much as advertised.

Synchronous detection is a method of demodulating AM transmissions that involves "subtracting" the carrier from the signal instead of using rectification as a simple diode detector does. It offers excellent fidelity.

(I'll try not to get TOO technical here, but here goes)
Most AM radios (including SW sets) don't use synchronous detection, they use a diode and a capacitor instead. The frequency response of a diode detector is limited because of the impedance of the capacitor used to smooth the rectified signal drops at higher frequencies, making it useless above 5000 Hz. This is necessary because using a capacitor with an higher impedance at those frequencies does not do a sufficient job of smoothing the signal. In other words, the value of capacitor used is a tradeoff between overall fidelity and frequency response. This is why AM radios sound so bad even though the sound quality of the transmitted signal is frequently excellent.

A synchronous detector is capable of much greater frequency response because it does not modify the information part of the signal at all. It simply removes the carrier and leaves the information alone. It is called a synchronous detector because you must have a subtraction signal that is the same frequency as the carrier (i.e. they must be synchronized). This is normally done after an IF stage so this is not a problem.

There are synchronous detectors available on integrated circuits so it is not real expensive to implement; however most receiver manufacturers are not using them. I have heard the difference and I think it is well worth paying a little extra for synchronous detection; it sounds MUCH better.

If the sound quality of broadcasts is important to you then make sure you get a radio with a synchronous detector. You won't be sorry.

>They set out to teach you the ***theory*** of electrical communication, etc.,
>not operating techniques. [...]

Bob,

My note was an example of "reducto ad absurdum". (No, I didn't take Latin, but I still know what that means. For those who don't, my dictionary defines it as "the refutation of a proposition by showing its logical conclusion as absurd.")

I find it hard to understand why amateur radio should have, as a basic and fundamental requirement, something that no self-respecting engineering college (or even a technical school) requires of its graduates who desire to pursue communications, including radio, as a professional career. (Before you say "but ham radio is a hobby, not a profession", please explain why a hobby should have stronger qualifications than a professional position in a similar field.)

The issue is not one of "educational breadth". Nor is it valid to argue for a "no theory" license by claiming that you don't need Ohm's Law to talk on the radio. The simple fact is that to pursue the Basis and Purpose of the Amateur Service (as opposed to merely talking on the radio) some understanding of theory as well as rules and regulations is necessary.

But it is entirely possible for someone WITHOUT any knowledge of the code to meet any and all of the five "raisons d'etre" for the Amateur Service. This is the exact reasoning the FCC used in its last no-code proposal, and it is even more valid now.

Phil

Tom Peters (of "In Search of Excellence" fame and from the Stanford B-school) recently wrote an excellent column extolling the virtues of requiring more breadth in engineering education (or rather decrying the lack of). About six months ago, the NSF also came out with similar comments. Engineering programs concentrate on Theory and not practice; this is true at almost all levels from undergrad up to doctorate education. Would you like to know how many EE grad students can't solder? How even fewer can tell you what solder is, what a eutectic point is?

I've heard a number of excuses for all of this; "Students should do that on their own", and "we don't have the time" are two of my favorite fantasies. Maybe it's time to add a fifth year to the engineering curriculum.

Of course, I'm only addressing one direction of breadth; it would be nice if we could add business, law, and psychology courses in as well, but as it is, engineering is still one of the most demanding courses of study.

I couldn't agree more, Bob.

More information is emerging about cutbacks in QST. In an earlier posting I mentioned that The New Frontier was the only column being dropped, and that still seems to be the case. However, other columns may be appearing bimonthly (every 2 months) or may be restricted in length. It is difficult to get the straight story but I am trying to report only what I have heard. So far the affected columns are "YL news", the QSL bureau part of "How's DX", "FM/RPT" and "The World Above 50 MHz". I will try to get the whole story from ARRL HQ before posting more, but even there not everyone seems to know Some HQ personel are as upset about the changes as the rest of us.

> WB6JZL

If you look at the picture, there is a "Black-box" at the base of
the antenna where the feed-line connects. I have not been able
to see what "Magic" is in there cuz i culd not get it apart. I really
did not want to break the weather-proofing anyway. It does not
take batteries or a phantom power source. It appears to me to be
an elaborate passive matching network of some kind. One interesting
note is that the upgrade kit from R4 to R5 to add 17m does not
have anything to do with the "Box". Whatever is in there, it keeps
the SWR fairly flat across entire bands. I give this 'tenna high
marks for a compact, no radial, no hassle vertical. One final note,
I assembled it the way the instructions indicated, and I only had
to go up and adjust the height ONE INCH to optimize the SWR lo
point to my taste on 15m. Virtually NO adjustment was required.

I seem to have the same problem with weighing the arguments FOR a
no-code license. It seems to me to be a group of folks trying to
lower the water (requirements) instead of raise the bridge (our own
personal acheivements). IMHO, since amateur radio is for the
experimenting and enhancement of an art/technology, that it is not
unreasonable to require a little HISTORY or background knowledge
before diving head long into PIONEERING. If your personal desires
are not in line with the current definition of ham-radio, perhaps
it is something else you aspire to. Five WPM is not exactly asking
you to become an expert.

> Could you post some really GOOD arguments to explain why and how a codeless
> license is not good for amateur radio and/or is in direct conflict with the
> goals of amateur radio (as per 97.1) and the public in general (such as why
> someone who does not want to learn code should not be a participant).

I have heard equally flimsy arguments FOR the no-code license. The
fact is that no matter how much arguing we do, the truth is in the
puddin'... There is no way to tell utill we try it, however, if it
has undesireable results, it will be darn hard to undo....
I agree with the 1 or 2 year expiration to the new class of license
because when I had a 2 year CODE ONLY and ROCK-BOUND ticket, I could
not wait to upgrade. It definitely WAS incentive to upgrade, but
now even Novices have VOICE on 10m. If the argument of "WHAT IF ALL
I WANT TO DO IS WORK 440mHz FM and don't want to upgrade" issue
arises, then perhaps an AMATEUR-RADIO license is not what you want
in the first place. They could start a whole new service apart and
inbetween CB and the ARS, call it COMPUTER-RADIO-CITIZENS-SERVICE
and feel free to write your own requirements for it. If the no-code
license is at such odds with the ARS, perhaps it should be an entity
of it's own......

TRIVIA QUESTION: If you put 1/2 the effort expended on arguing the NO-CODE
license issue into learning CW, how fast would you be
copying today ?????

Not intended to offend....
Is this frequency in use...

2067. The Sun SPARCstation 1 and Amateur Radio

Newsgroup: rec.ham-radio
Date: 1989-08-10 23:13:52 UTC
From: cas@hoptoad.uucp
Message-ID: <8261@hoptoad.uucp>
Source record: 17501

The other day our first Sun 4/60 SPARCstation 1 arrived. If you are not familiar with this (IMHO) wonderful piece of equipment, it has "Audio", which is why I am writing this message.

A partial description from the man pages follows (printed without permission):

"The audio device is a SPARCstation 1 specific device that implements telephone quality sound using the AM79C30 Digital Subscriber Controller chip. The chip uses a sampling rate of 8192 samples per second, with each sample being 8-bits. The chip has a built-in analog to digital converter (ADC) and digital to analog converter (DAC). The chip uses either u-law or A-law compression, and will drive either the built-in speaker or an external headphone jack."

The first thing I did was hook up the microphone to the 8 pin mini-DIN connector and recorded my voice saying CQ CONTEST CQ CONTEST CQ CONTEST FROM N6ECT N6ECT NOVEMBER 6 ECHO CHARLIE TANGO and saved it to a file. When the programme 'sound' comes up, it makes it's own window and has a number of options, including a graphical output of waveforms similar to an oscilloscope display. I then set the 'Output' for the internal speaker, turned 'Looping' on, and toggled the 'Play' mode with the mouse. There was "me" calling cq contest with what I would call "fine audio quality" or :-) the first step towards a phone contest dream. By turning on the 'Looping' it repeated itself, until I toggled the 'Pause' mode with the mouse, which can be 'Continued' with another tap of the mouse button. After trying various other voice experiments I realized that maybe it would take the output from my Bencher paddle and Curtis keyer, which it did, and created a few practice CW files, that also sounded great. I was also able to feed my scanner audio into it, and save the information to a file. I haven't tried music yet, but that's for latter today (-:. I am looking forward to hooking a RS-232 based radio to one of the serial ports with the audio i/o from the SPARCstation 1 connected to it. I once remember telling Hank Magnuski, KA6M and Paul Rinaldo, W4RI at the 2nd ARRL Amateur Radio Computer Networking Conference in 1982 that I wanted to be able to turn my radio/computer/beam-pointer on a Friday and send in for my DXCC on Monday (-: ... :-) guess that I'm getting closer. Another thing that I want to try is feeding the audio from one of my radios into the SPARCstation 1 and transmit a packet beacon. I then want to re-transmit the saved beacon without the use of a TNC, and see if I can receive it.

Well, I guess that you can see my excitement and the new door of experimentation that has opened for me. If anyone else has a SPARCstation 1 and is contemplating doing similar experiments... LET ME KNOW... 73

Disclaimer: No I don't work for Sun, but (IMHO) they sure make nice equipment.

Folks,

Several months ago I posted a query regarding controlling the 940 from a RS-232 device (Mac IIX in my case). I received two very helpful responses. After several months of foot-dragging on my part, etc; I figured it was time to get around tuit. I purloined the appropriate hardware - MC1489P's, MC1488P's, even some 7805C's and D8251AC's. That oughtta do it - I thought. Then I picked up the August issue of "73". On page 34 begins a relevant article called "Control Your Rig from a PC". Hmmm, maybe this'll be useful for my project. After reading the article, comparing notes with the responses received earlier, and finally a call to Kenwood, I'm totally confused. Do I, or don't I, need the "IC-10B" interface kit - which contains an EPROM. I thought I would need it (but haven't bought it yet!). The fellow at Kenwood said "No, it's in there." (but then that was AFTER I told him I was pondering building it from scratch ;-)). My previous notes made responses on this subject made no mention of any EPROM.

As an aside, I asked the fellow at Kenwood what the advantage - if any - would be in me buying the kit(s) from them versus building them, the conversation continued:

Kenwood: "Well, you might destroy something in your radio."

Pete: "How's that?"

Kenwood: "If the voltages are over 7 volts, well, it's possible... You could void your warranty on the 940."

Pete: "What else?"

Kenwood: "Well, if you build it yourself there's no warranty on it."

Pete: "Anything else?"

Kenwood (with confidence now!): "You wouldn't know the command set that you need to control it with!"

Pete: "Oh but I <do> have the command set!"

(Get ready for a good one:)

Kewood: (wavering now...) "You're not just paying for the chips, you're paying for the TECHNOLOGY! It's only $50..."

Pete: "Well, I really appreciate your time..."

Can anyone clear this up for me? I appreciate your time and help very much!

73, as always, Pete, N5KBD

I'd second Paul's comments. Perhaps this is perhaps a bit far afield from
ham radio, but then again, mayby not. Education is a reason we tend
to banter about with relative impunity when justifying our service.

My experience in running a small high technology company (about 25 people)
has been that the productivity and ease of management is generally inversely
proportional to the number of years they spent in a university environment.
Even in the rather esoteric (sp) field of nuclear engineering, the people with
a good trade school or BS degree were VASTLY more valuable to me than those
with (sometimes) many PhD's. Of course, I kept one or 2 around just to
run out on the masthead but that's a different story.

My experience with applied engineering education is that the system has
failed miserably. And we've gone through a generation of non-education
so that now it's questionable whether the schools COULD teach even
given a chance. I suppose we can blame this beginning in the '60s
when the universities became centers for socal activism instead centers
for higher education.

And even those engineers that learn a bit of theory learn practically nothing
of the practical world. I remember visiting a graduate electrical
engineering class a few years ago and marveled as I watched 2 PhD candidates
try to solder a component to a circuit board without solder. When I
inquired, they told me they thought one simply melted the lead with iron!

Even as I look around my present environment, I see that some of the best programmers and programming managers are non-degreed (myself included - I have an engineering apprenticeship certificate). It does make one wonder when most people remember the parties they attended much better than they remember any class.

Paul, I don't think we need another year added to engineering school. I think people like Phil K. are geniuses DESPITE higher education. I used to run around with a person like phil. We both laid out of class practically our whole junior and senior year in high school. The difference was I earned Bs and Cs while he made straight As and aced the SAT. And we had a GOOD school, one of the tops in the nation. I think profound changes will be necessary. I can certainly testify as to the effectiveness of the engineering apprentice system. This is certainly food for thought and discussion.

That's right! Now's the time to order pizza via the autopatch, and charge it
to someone else's credit card that you got from a local BBS! And don't
forget to confirm your order with "10-4 good buddy!"

(Now, I suppose if you used EME propagation and ordered a new kind of pizza
that you weren't sure you'd like, that would be classed as experimental work...)

I now have three versions of satellite trackers on hand.

1.) My GFA Basic (for the ATARI ST) source listing.

2.) My compiled version (for the ATARI ST.)

3.) A "C" language satellite tracker program (not mine.)

#1 Was posted to comp.sources.atari.st
#2 Will be posted to comp.binaries.atari.st
#3 Not posted (but available on T. Kelso's BBS as the Seesat program.)

All three programs are also available from me for the asking.

> Synchronous detection is a method of demodulating AM transmissions
> that involves "subtracting" the carrier from the signal instead of
> using rectification as a simple diode detector does.
> etc......
> WN4BBJ

When I read this I felt I should throw in my (radically different) two
cents worth:

The constant fading of a shortwave signal is said to be "selective."
That is, it affects the different frequencies within the bandwidth of
the signal in different amounts. If the carrier signal strength is
severely reduced by selective fading and the sidebands are not
correspondingly reduced by the fading, the result is that, for a short
period of time, the carrier strength is not sufficient to provide
enough demodulation of the sidebands, resulting in a burst of signal
that sounds more like SSB than AM.

Synchronous AM detection superimposes a carrier onto the carrier of
the received signal. This internally-generated carrier is
"phase-locked" to the received signal carrier and it can remain at the
proper frequency even if the signal carrier fades out for a short
period of time. The strong internal carrier insures that the
sidebands are always sufficiently demodulated.

I believe the Sony 2010 is the only radio (less than $5000) with this
feature.

2074. Re: Proposed 220MHz-and-up No-code license

Newsgroup: rec.ham-radio
Date: 1989-08-11 05:06:43 UTC
From: tad@ssc.UUCP
Message-ID: <131@ssc.UUCP>
Source record: 17506

In his posting about no-code, John Painter says: "As to code-free hams turning the bands into muck, I have yet to see anyone from a country with a code-free license complain. Stick to facts, not suppositions."

I wonder if he has ever spoken with anyone in Japan? Japan is commonly used by no-code advocates as an example that we should aspire to. I have hosted a number of JA ham visitors, and they ALL tell me that as a result of the communicator type license in Japan, two meters is nearly unusable. According to JH3HBF and JA5GLY, to give two examples, the 2 mtr band in Japan is completely over-run with kids playing space-patrol on their Trio (Kenwood) and ICOM handhelds. Forget about any repeater operation or autopatches. And these are not CB type pirates....all of these kids have a legal JA call that allows them to operate the VHF bands without knowing the code. And this is in a country that values order, cooperation and consensus very highly!

Now I am not sure that I am really against having a code-free license, and I also am not certain that our experience has to mirror Japan's, but if you want an example, here is one!

Anyone else have any other examples?

The "ANARC Guide to U.S. Monitoring Laws" has just gone into its second printing. Compiled by ANARC's counsel, Frank Terranella, N2IGO, this forty page, 8.5" x 11" paperback is the only current anthology of state scanner laws in print. Easy-to-understand analyses accompany the full texts of laws from California, Florida, Indiana, Kentucky, Michigan, Minnesota, Nebraska, New Jersey, New York, North Dakota, Oklahoma, South Dakota, Tennessee and Vermont. Also included are relevant passages of the federal Electronic Communications Privacy Act, and an essay translating the ECPA into plain English.

Phil,
Thanks for the response. However I think you missed my point. I was trying
to point out that you, trained and hired to design apparatus/systems, are not
necessarily expected to be able to efficiently use them. No one expects
all the people who design Boeing 747s to be able to fly them, etc., etc. The
is another class of lesser beings who are operators, and need to demonstrate
their ability to obtain operating privileges.

There has been far too much discussion of what abilities they need to dedemon-
starte for ham privileges, so I won't go further.

LET'S STOP THIS "EDUCATION" DISCUSSION BEFORE IT, TOO, SWAMPS THE CHANNEL......

Don't blame the envelope detector for AM frequency response
woes, because an AM envelope detector is inherently a high fidelity
device. Even at the less-commonly used IF bandwidth of 262.5 kHz, it
is **trivial** to design an envelope detector with reasonably flat
frequency response to 10 kHz, which is the upper limit for NRSC-1
equipped standard broadcasting stations in the US.

The lack of bandwidth in an AM receiver is completely due
to excessive selectivity in the IF amplifier stage. This selectivity
is provided to 1) save money (fewer stages of IF gain required) and
2) to eliminate first adjacent channel interference. "Modern" AM
receiver design use ceramic resonators, which necessarily have a
high "Q" and poor bandwidth.

The detector used in **ALL** modulation monitors (with
possibly the exception of the Delta Electronics splatter meter)
is envelope detection. The Belar AMM-3 is flat to 30 kHz. Many
colour television sets use envelope detection under much more severe
carrier - to - baseband conditions than a simple AM radio.

Of course, this all means diddly squat to a SWL, who is
basically listening to islands of signal in oceans of interference.

The advantage of synchronous demodulation is that 1) it
is trivial to design one which receives either the upper or the
lower sideband only and 2) it is more free from quadrature distortion
due to carrier phase rotation (particularly a problem in skywave
reception). The synchronous demodulator also does not suffer
from severe distortion under carrier-only amplitude distortion

(selective fading, again principally a skywave condition);
this is also a benefit for listeners in the "null fields" of
a BC directional station.

The disadvantage of a synchronous demodulator is
cost. In the presence of heavy QRM, synchronous detectors
sometimes "act funny" and reduce communications effectivness,
though the theoretical advantages of sync are undisputed.
This is probably more an implementation issue rather than
an inherent problem.

Finally, you still have to have an integrating
type carrier detector to implement AGC. You get this DC
control voltage at no extra charge with an envelope detector.

'Nuff said.

|
| =+=
|
| Hey bruddah..... I started with the HT-40 and SX-140, and they worked
| rather well. I worked something like 150 countries and 50 states with
| that pair. With careful tuning of the external VFO (A Knight-Kit) you
| could talk to SSB'ers with the carrier-controlled (screen) modulation of
| the HT-40, and they'd "think" you were SSB with a bit of carrier
| imbalance.
|
| If you adjust the regeneration control properly (whatever the name was, I
| forgot), and align the beast, the selectivity isn't TOO bad. I once
| traded it in on a Hallicrafters SX-101 (maybe 'A', I forget), but took it
| back, the SX-140 was better. That control basically was a built-in
| "Q-multiplier".
|
| BTW - I also won several contests with them.
|
| 'Course, it didn't hurt to be KH6FON at the time.... :-)
|
| If I saw one at a hamfest for $5, I'd snap it right up!!!!! :-)

2081. synchronous AM detection

Newsgroup: rec.ham-radio
Date: 1989-08-11 15:31:00 UTC
From: CSMSCST@OAC.UCLA.EDU
Message-ID: <8908120702.AA04410@ucbvax.Berkeley.EDU>
Source record: 17498

> I believe the Sony 2010 is the only radio (less than $5000) with this
> feature.

Actually, any communications receiver that has an SSB mode
does synchronous detection -- and you have the choice of
which sideband, upper or lower, to detect. Usually, there
is less QRM on one side than on the other. My Kenwood R-5000
does just fine. Note that you need to have an IF filter
narrow enough to remove the carrier. If you leave your
receiver in AM mode (usually wide) and turn on the BFO, you
don't get the fading reduction.

The advantage of the Sony 2010 is that it *automatically* locks
onto (zero beats) the carrier. This is a touchy tuning adjustment
otherwise. The 2010 is a neat box.

2082. Re: Public Perception of Ham Radio and

In article <5683@b11.ingr.com> herbster@b11.ingr.com (Joe Herbster) writes:
}In article <30500126@ux1.cso.uiuc.edu>, phil@ux1.cso.uiuc.edu writes:

}> >From: jay@splut.UUCP
}> > Phil, some of us find the rebuttals insufficient to address the very
}> > real problems with no-code. I've weighed them, and they come up short.
}> [....stuff truncated]
} I seem to have the same problem with weighing the arguments FOR a
} no-code license.

All right let me state tree:

1) CW is irelevant to many types of radio operation and radio uses today.
It is not used significantly in commercial, military or emergency work.
In short the "world of radio" has changed.

2) In other countries it has proven to be ONE of the ways (not alone) to
increase the pool of good ham operators.

3) The competition for frequency space in the VHF/UHF spectrum is several
hundred times as intense as it was say 10-20 years ago largely due to the
availability of cheap, easy to operate and reliable equipment.
The 220Mhz debacle is only the tip of the iceburg.

}It seems to me to be a group of folks trying to
} lower the water (requirements) instead of raise the bridge (our own
} personal acheivements).

This is simply not so for any of the current proposals. The proposals
substitute more relevent tests for the CW test.

}IMHO, since amateur radio is for the
} experimenting and enhancement of an art/technology, that it is not
} unreasonable to require a little HISTORY or background knowledge
} before diving head long into PIONEERING. If your personal desires
} are not in line with the current definition of ham-radio, perhaps
} it is something else you aspire to. Five WPM is not exactly asking
} you to become an expert.

I s CW the ONLY "history" or "background" to ham radio? The "art" is that
of COMMUNICATION, CW is merely one means to that end.

}> Could you post some really GOOD arguments to explain why and how a codeless
}> license is not good for amateur radio and/or is in direct conflict with the
}> goals of amateur radio (as per 97.1) and the public in general (such as why
}> someone who does not want to learn code should not be a participant).

} I agree with the 1 or 2 year expiration to the new class of license
} because when I had a 2 year CODE ONLY and ROCK-BOUND ticket, I could
} not wait to upgrade.

I'm not sure what this has to do with a codeless license.

Is this the philosophy that to learn to fix cars I must endure being hit on the head every morning? That shows due dilligence on the part of the learner or something I guess.

Seems a little crazy to me.

}It definitely WAS incentive to upgrade, but
} now even Novices have VOICE on 10m. If the argument of "WHAT IF ALL
} I WANT TO DO IS WORK 440mHz FM and don't want to upgrade" issue
} arises, then perhaps an AMATEUR-RADIO license is not what you want
} in the first place. They could start a whole new service apart and
} inbetween CB and the ARS, call it COMPUTER-RADIO-CITIZENS-SERVICE
} and feel free to write your own requirements for it. If the no-code
} license is at such odds with the ARS, perhaps it should be an entity
} of it's own......

That is a very real possibility. Class D CB started out with much of that intent.

}TRIVIA QUESTION: If you put 1/2 the effort expended on arguing the NO-CODE
} license issue into learning CW, how fast would you be
} copying today ?????

About the same - 35-40wpm.

You learn something by using it, not by studying for tests on it.

>I couldn't agree more, Bob.

I'd second Paul's comments. Perhaps this is perhaps a bit far afield from
ham radio, but then again, mayby not. Education is a reason we tend
to banter about with relative impunity when justifying our service.

My experience in running a small high technology company (about 25 people)
has been that the productivity and ease of management is generally inversely
proportional to the number of years they spent in a university environment.
Even in the rather esoteric (sp) field of nuclear engineering, the people with
a good trade school or BS degree were VASTLY more valuable to me than those
with (sometimes) many PhD's. Of course, I kept one or 2 around just to
run out on the masthead but that's a different story.

My experience with applied engineering education is that the system has
failed miserably. And we've gone through a generation of non-education
so that now it's questionable whether the schools COULD teach even
given a chance. I suppose we can blame this beginning in the '60s
when the universities became centers for socal activism instead centers
for higher education.

And even those engineers that learn a bit of theory learn practically nothing
of the practical world. I remember visiting a graduate electrical
engineering class a few years ago and marveled as I watched 2 PhD candidates
try to solder a component to a circuit board without solder. When I

inquired, they told me they thought one simply melted the lead with iron!

Even as I look around my present environment, I see that some of the best programmers and programming managers are non-degreed (myself included - I have an engineering apprenticeship certificate). It does make one wonder when most people remember the parties they attended much better than they remember any class.

Paul, I don't think we need another year added to engineering school. I think people like Phil K. are geniuses DESPITE higher education. I used to run around with a person like phil. We both laid out of class practically our whole junior and senior year in high school. The difference was I earned Bs and Cs while he made straight As and aced the SAT. And we had a GOOD school, one of the tops in the nation. I think profound changes will be necessary. I can certainly testify as to the effectiveness of the engineering apprentice system. >inquired, they told me they thought one simply melted the lead with iron!

First, 'sorry about the previous response (a botched q!).

I have noticed the same problem when interviewing candidates. Particularly,
ones with undergrad degrees from "big name universities". 'Seems like
many of them leave with very little applied/practical knowledge. This is
OK BUT... if that particular engineering student doesn't make their field
their hobby, they can end up in the situation described above. No, I'm not
just talking about knowing how to use a soldering iron but about
things such as how basic logic functions work, principles of decoupling TTL,
designing for reduced RFI, storing a "1" in a flip flop and many other
"basics".

My theory is, that they concentrate on theory taught by graduate students
because the professor is too busy to profess or to discuss anything with them.
Their tuition is being wasted. In California, there is an excellent
State University system and, at a reasonable cost, they provide very
good theoretical background AND practical background. These are the
true "broad engineers". Don't get me wrong, this isn't limited to California's
universities. I'm just using it as an example because of familiarity.

Then, there are those who took engineering
"because it was the thing of the future" and they read a lot of hype
about the demand for jobs in that field and figured that they could
make big money "doing it". A true engineer LIVES the field, they like
to tinker and were most likely interested in the field before attending
formal training. You know the type. They had cables strung all over their
bedrooms when they were kids, blackened the wall sockets in their rooms :-)
and made crude electronic gadgets before knowing the subtleties of
electronic design.

The other types usually migrate to a non-technical job after becoming
employed and tend to wear polyester and sell things :-)

>JH3HBF and JA5GLY, to give two examples, the 2 mtr band in Japan
>is completely over-run with kids playing space-patrol on their Trio
>(Kenwood) and ICOM handhelds...

why is playing space patrol a less valid use for amateur radio than,
say, discussing the results of one's most recent medical procedure?
why should children playing space patrol have to deal with the lousy
fidelity and performance of am cb sets when characters in films on
space patrols have the fidelity of fm?

>Forget about any repeater operation or autopatches.

why are autopatches informing the spouse ``i'm on my way home'' a
more legitimate use than ``space patrol?'' and why wouldn't the
band plan protect repeaters with autopatch from simplex space patrols,
anyway?

>...Now I am not sure that I am really against having a code-free license,
>and I also am not certain that our experience has to mirror Japan's,
>but if you want an example, here is one!...

assuming the desire is to prohibit too many children with insufficient
medical procedure experience from operating amateur stations, the
fcc should look at the exams used for japan's code-free license,
and see if our's shouldn't be more difficult.

Re: Broader education

Japanese engineers are trained in a very practical, problem-solving regime.

One might speculate as to the relative value of theory vs. practicality but that would be too simplistic.

An interesting data point however.

Folks,

Some ne'er do well hoodlums vandalized my dual band antenna on my truck so I'm in the market for a new one. The deceased antenna was a Larsen 2/70. Not bad, I guess, but is there anything else currently available that might be "better"? How is it better? Who makes it? How much? I'm not especially interested in the "thru glass" types, unless there are some that are really worthy - "looks" alone doesn't mean much to me. I appreciate your thoughts on this. Don't have a lot of time though - I'm currently off the (VHF/UHF) air! :-<

Dear Joe,

While Phil Howard may have a 5 wpm ticket, you might note that
Phil Karn ka9q and I (k1io) do not have callsigns that you get for 5
wpm. Or for 13 wpm, like yours. Many of us no-code rooters are very
good at it. We just don't think that the code REQUIREMENT is good for
ham radio as a whole.

(and here he's responding to phil howard)

> I agree with the 1 or 2 year expiration to the new class of license
> because when I had a 2 year CODE ONLY and ROCK-BOUND ticket, I could

> and feel free to write your own requirements for it. If the no-code
> license is at such odds with the ARS, perhaps it should be an entity
> of it's own......

Obviously, you believe that the Basis and Purpose of Amateur Radio is to
train people in the sacred code. Phil Howard's proposal actually did
include two codeless classes, so there is room to upgrade to something
at least as tough as the Advanced. Is that bad?

Personally, though, I don't think the AR license structure should be
viewed as an educational tool per se. We don't take away your motor
vehicle driver's license for failing to be able to change oil, fix
brakes or re-gap the spark plugs, so why should AR require upgrading?
Now if somebody wanted to claim to be a mechanic, I'd have different
ideas from a driver's license. But the code? More like learning to fix
the crank on your Model T.

Remember, you heard that from a regular CW op, who also likes other old
things, but recognizes that GM would have gone out of business if they

sold cars the way we sell our sport/hobby/avocation.

2092. New Icom Radio's

Icom has done it again. This time they managed to release 2 new radios
without the usual pre-release hoopla.
1) IC-726. This is the IC 725 with 6 meters !! price around $1250.00 discount.

2) IC-2400. This is a new dual band 2/440. Price around $900.00 discounted

IC 735's are starting to become available again. PASS BAND tuning is STILL
in the radios.
IC- ()sat's the super small HT's are starting to trickle in.

2093. Re: Synchronous AM detection

Newsgroup: rec.ham-radio
Date: 1989-08-11 20:16:17 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <8908120703.AA04485@ucbvax.Berkeley.EDU>
Source record: 17511

Thanks to those who posted the interesting info on this subject! Since the Sony 2010's synchronous detection was mentioned, I have a question about its operation. I have noticed this on my 2010, and I have also read comments about this in reviews of this radio, so I know it is a problem inherent in the design and not just a defect in my sample: When the 2010 is used in synchronous detection mode, at odd times during the reception the audio will be overlaid with a growling or motorboating sound. If you hit the "sync" button twice, to turn off and turn back on synchronous detection, the sound goes away. Retuning slightly sometimes has the same effect. This does NOT seem to be related to signal strength of the received signal -- it will happen on strong major broadcasters that light up the whole S-meter LED display. (You'd use sync on these in order to reduce interference.)

What this means is that you really cannot use the 2010 in "sync" mode for unattended recording of a signal, even though it comes with all sorts of timer facilities just for that purpose! Your reception may be wiped out by this growling and only manual intervention to take the machine out of and back into "sync" mode will fix it. (You can, of course, use it for timer-based taping when not in "sync" mode, but then your reception may suffer from fading or interference that the "sync" mode is designed to combat.)

I feel this is a much more serious problem than the reviewers have indicated. They have mentioned it in passing as a slight annoyance, but I tend to think of it as a major failing. It is not uncommon -- every time I try to use "sync" mode to listen to a broadcast over more than 15 minutes or so I get this failure and lapse into noise. Since I was there and could fix it, it hasn't created any real difficulties for me, but it certainly would for someone trying to use the 2010 for timer-controlled taping when the signals they wanted to receive required the use of "sync" due to reception conditions.

Does anyone out there know just what is going on when the set begins this "growling" noise? Is it caused by the loss of lock of some sort of PLL circuit? I ask that because the noise is somewhat reminiscent of the noise my old Galaxy R-530 PLL receiver would emit when it was not locked and couldn't receive any signal.

Does anyone know of any comment from Sony about this? I wonder if there is some sort of circuit-fix that they and their repair stations know about that could be applied to existing 2010's to eliminate this failing.

Regards, Will

What hasn't been made clear in this discussion is just how cutting back on these columns is going to save the ARRL any money. Surely they don't pay these columnists (or column editors) all THAT much! (Actually, I thought most of these were volunteer unpaid contributors, or paid at most some nominal amount to cover their postage expenses, etc.) So how is dropping these features going to save money?

Is it that the dropped editorial content frees up more pages for advertising, and they have had a waiting list of advertisers wanting to get into QST but they couldn't accomodate them? (Without expanding the magazine which would have to go up by some printer-determined chunk of pages and thus increase both printing and miling costs, that is.) That seems unlikely -- they still seemed to have enough extra space that they filled with "house" ads for ARRL publications and services, etc. It seems unlikely that dropping these columns will automatically allow a sizable increase in ad revenue.

So how is mucking about with the contents of QST going to save the ARRL any noticeable amount of money or generate much more income? Especially considering the number of people who seem irritated about this enough that they will be not renewing their memberships, thus cutting off that revenue, it doesn't seem too cost-effective.

Will

Although this doesn't really pertain to the argument, I just wanted to
make the following small correction.

An operator license callsign of the 2x1 variety (e.g. KA9Q)
indicates the holder passed a 20 WPM code test.

An operator license callsign of the 1x2 variety (e.g. K1IO)
only indicates a minimum proficiency of 13 WPM, unless it
is a N#xx callsign.

> rotation (particularly a problem in skywave...
why is this (mathematically)?

My concept of sync demodulation is to regenerate a local version of the
carrier (via phaselock?), limit it, and multiply the <if> by it. This may
be naive. I would enjoy learning of other techniques, especially which
support statement (1) above.

Exactly, which is why the FCC rules also include specific provisions for
emergency communications.

> >You are facilitating the regular business by simply having ONE ELEMENT of
> >a transaction on the repeater, and that facilitation is prohibited by FCC
> >rules (and you know which one I mean).
>
> Oh really? So if I happen to mention that we should all meet at Stuft's,
> since they're having a special on Sicilian pizza, this is a violation?

It COULD BE, but since it is not at all part of the actual transaction, I
really suspect this is not prohibited. If you are the owner or an employee
of Stuft's, however, it is ONE OF THE transaction elements: ADVERTISING

> >They are allowed because the FCC has considered the rule allowing transmission
> >of informational messages concerning amateur radio to override the rule against
> >business transactions when such messages simply provide information about the
> >availability of amateur equipment for sale, or desires of individual hams for

> specific legal niche

Well, the whole legal process of rules and laws in this country is supposed
to be that we-the-people get it the way we want it (if we can agree on it).
If we WANT to be able to call Stuft's on the autopatch, we should ask the
FCC to make a rule that allows it.

> >What courses have YOU taken?

--------------==========================
I agree... Although someone probably does need to be explaining the law
to hams, it does need to be pointed out in ANY explanation, just what the
role of those doing the explanation really is.

> interpretation of the law, which may result in a formal tightening of the
----
I can see where this can be a problem. It does appear that the ARRL is
being a bit too conservative on the issue, but my own interpretation (for
MY purposes as you know) still leaves the actual ordering of a pizza over
the radio as prohibited. But, I'd like to change that.

> law in the future. No, I'm not a lawyer (I don't even play one on TV).
> And no, none of what I've written constitutes legal advice; it does

> Jim Vienneau KC1OU
> sun!suneast!jimv

I must have missed it. I have heard many arguments, but I can't tell which it is that you feel is a good one.

I am collecting the arguments I've heard, and planning to summarize. Since my personal position is in favor of a codeless license, if my summary is biased, it would be biased in that direction. So, someone still needs to be ready to summarize from the other side as well.

One thing we definitely need to do is to make sure we are arguing the same issue at the same time. There are quite a number of distinct issues in this matter, so we do need to be careful with it. Sometime soon I will post a list of the issues/arguments that I have heard, and maybe we can have some sensible and civilized debate, not an emotional flame war.

I do see where we have a problem. Each of us believes the other has no good arguable position at all, and thus it is difficult to post what we believe the best argument is, because that is going to end up being: "because their is no good counter argument". Are we trapped?

Let me ask this question:
What group of people should have the authority to decide just what requirements are necessary of an individual to grant access to that individual to a portion of the radio spectrum for the purpose of experimentation and public service?

I am going to argue that we hams, who already use some of these frequencies, have NO MORE authority on the matter than the GENERAL PUBLIC, whose ultimate benefit EVERY RADIO SERVICE is supposed to grant. Amateur Radio has a clear mandate to SERVE THE PUBLIC. It is a service, not an exclusive club.

Lots of scientific and engineering graduate programs require that their students learn a foreign language to some extent. Usually the requirement is to have "dictionary reading" capability; not fluency.

Morse Code still exists in Amateur Radio, and no one (that I know of) has seriously proposed taking it away. The level of learning Morse Code we now have to master to be licensed is equivalent to a level of fluency; in other words, we have to be able (at least on the day of the exam) to carry out a conversation (QSO) in it.

Why can't the Morse Code test be simply a set of questions that test your understanding ABOUT Morse Code, and be a part of a unified exam element?

Sometimes being "not ... TOO technical" just doesn't help in understanding.

I have never heard an explanation of just what syncronous detection is, but I have made what I believe is a good guess. Unfortunately, your non-technical explanation leaves me no more or less informed as to how well my understanding of it really is.

In particular, what do you mean by "subtracting"? Could you read through my explanation and let me know if this is what you mean by syncronous detection (if I am not too technical)?

Clearly, the mere removal of a carrier from the AM signal in the IF stage is not what you meant, because that would leave you with two sets of sidebands around the IF frequency.

However, syncronous detection as I see it is little more than a sophisticated version of SSB reception. Here is my slightly-more-technical explanation:

A very narrow filter at the exact center of the IF bandpass strips off a copy of the carrier. Another circuit reproduces that carrier (by any of many possible methods) in a pure form. This carrier is then used as a "BFO", but instead of simply being injected into the signal, it is modulated with it using a balanced mixer. This results in signal products at 2*IF as well as BASEBAND audio. A smooth rolloff low-pass filter can then strip off the 2*IF and any leaking IF signals, and leave an accurate audio reproduction.

This scheme can also be used to detect 2 other modes related to AM. The first is simply AM with a reduced carrier level. On an ordinary "envelope stripper" the sound quality would be terrible in this mode. The syncronized carrier would still be stronger than the sidebands it is intermodulating with so it can detect just the sidebands quite well. It is only necessary to have enough carrier to syncronize with. The second mode is one where the original carrier is shifted by 90 degrees. This trick has the curious effect of reducing the envelope peaks of the AM signal, even though the carrier is at full strength. This is because a carrier at 90 degrees off will demodulate one sideband at 180 degrees from the other sideband (one +90, the other -90). Some envelope will still exist and will represent intermodulation directly between the sidebands, and will be at 2*F where F is the audio frequency. The syncronous detector would have to have a -90 degrees phase shift to adjust

for the original phase error in the carrier.

A syncronous detector should also be able to detect, with best fidelity,
a SINGLE sideband signal with half (H3E) or reduced (R3E) carrier levels
present (legal on ham bands, too).

> HQ before posting more, but even there not everyone seems to know
> Some HQ personel are as upset about the changes as the rest of us.

Well, there goes half the membership already.

I just recently renewed my ARRL membership. I got my first renewal notice
BEFORE the latest board meeting, and sat on it pending the outcome of the
vote on the codeless license proposal. By the time I had heard that the vote
went the way I wanted, I had gotten a second notice. I sent that in with a
clearly written (in RED) description of why I waited to the second notice
and also subscribed to QEX and Gateway at the same time.

Well, I guess I'll give the ARRL and QST staff about a full year to get
things straightened out at headquarters before I decide if I am going to
renew for yet another year. If *MY* columns are not sufficiently present,
then you know what might happen. I will evaluate the WHOLE of the ARRL
for membership renewal purposes, but QST is a big part of it.

I believe the Sony 2010 is the only radio (less than $5000) with this feature.

Add the Grundig Satellit 500 and 650 receivers, at about $500 and $1000.

Phil,

Not knowing the depth of technical knowledge of the original poster, I
posted a simplistic answer highlighting the benefits of synchronous
detection rather than explaining enough for someone to build one.

To explain synchronous detection further I will publish an article on
the net in a few days explaining it in more detail. Hopefully this will
give everybody a better idea of what it really is than my simplistic
answer was intended to give.

>Thierry.

The Sony ICF-2010 portable (~$350) boasts a synchronous AM
detector. Switching it on causes phase distortion & heterodynes,
which have always been the bane of SWLing, to virtually
disappear. After years of trying to decipher the distorted
transmissions on the international broadcast bands, it is, at
last, a pleasure to listen to an intelligible signal.

Synchronous AM detection is a must for pleasurable listening to
the international shout wave broadcasts.

>Actually, any communications receiver that has an SSB mode
>does synchronous detection -- and you have the choice of
>which sideband, upper or lower, to detect. Usually, there

Not quite. You are just beating the sidebands down to baseband here. To achieve the full advantage of synchronous demodulation, which includes a 3 db gain in S/N ratio over asynchronous means, if I am not wrong, you need to have the injection oscillator be in phase lock with the received carrier.

There is a McGraw-Hill book called "Communications Receivers" by Rohde (yes, THE Rohde of Rohde und Schwarz, GmbH) and a second author whose name I don't recall. I think synchronous demodulation is described pretty well there, if I remember correctly. If there is enough interest, I will dig it out at home and get the ISBN.

Warning: Rohde is one of these chaps with many doctorates. If you believe what you have been reading here about breath in engineering, you may not want to read his book :-).

I wont re-post what Brian wrote, but I guess he really wants lots of kids playing space-ranger on 2 mtrs. The gall bladder operations that he mentions are bad enough.

Since he thinks that kids playing space patrol should be on FM and have hand-helds, what is wrong with 49 MHZ?

I am not against kids becoming hams (I was a child ham myself). I was giving the example of Japan, where a code free VHF license has made 2 mtrs practically unusable, according to JA ham friends.

2111. Technician Ham Stack v1.0 Bug fix

Newsgroup: rec.ham-radio
Date: 1989-08-12 22:19:35 UTC
From: dls@genrad.UUCP
Message-ID: <24729@genrad.UUCP>
Source record: 17440

While I was going thru the Technician Ham Stack today (yes, I really use
the software I created), I found a bug. For those of you who already
have v1.0, you can fix it by following these simple directions:

1. In HyperCard, Open "Technician Ham Stack", and wait until the "wait"
message goes away.
2. Press Ctrl-M to get the message box.
3. Type in message box:
set userlevel to 5
show menubar
go card "#107"
4. Press Ctrl-3 to go to next card.
5. Pull down Menu "Objects" -> "Card Info..."
6. Change card name from "#107" to "#108". (Remember, I told you to go
to card AFTER "#107" in step 3 above)
7. Press Ctrl-Q to exit HyperCard.
8. Select "Technician Ham Stack" file, then press Ctrl-I to "Get Info..."
9. Change the text "1.0" to "1.1".
BUG FIX COMPLETE, you now have v1.1 of "Technician Ham Stack".

WA1RHP has supplied yet another box of diskettes for Hams (and hopefuls).
I guess he figures making these stacks available at no cost is a way to
get more people into Ham Radio, so it's a good cause. I suppose I can
do no less than agree to pay postage to send out the diskettes; I guess
I can afford it on my Engineering salary (if GenRad stops taking money
away that is....:-)

One thing I noticed in the most recent issue of QST is that the Novice
and Technician questions will be changing as of November 1, 1989. Oh, well,
not even out two months and they are almost obsolete....:-(I suppose
MOST of the questions will be the same anyway, and if nothing else, they
STILL provide all the fundamental information that will be presented in
the new question pools. I don't expect to be buying the new Novice and
Technician questions, since I will have become a Technician by then (fingers
crossed), but if some kind ham would like to send me a copy of the new
questions (and answers) when available, I will update the Ham Stacks to
v2.x to accommodate them.

Cheers! Diana

--------------- ============
> personal acheivements). IMHO, since amateur radio is for the

Yes, there are in fact people who are trying to do that. The debates on
THAT particular issue started up here, but kept getting drowned out by the
"vs-no-code" debates, so I created a mailing list just for the purpose of
hashing/arguing/debating just what a no-code license SHOULD BE. There was
no consesus, and many people did want to "lower the water".

My proposal does NOT lower the water, nor do I see the ARRL proposal as
lowering the water either. By passing the written element that Technicians
NOW have to pass, you will get LESS privileges than Technicians today have.
My proposal goes a step further and provides for a class that gives the
licensee all privileges above 50 Mhz, but requires a much more comprehensive
technical and rules test to be passed.

IMHO.... we need, WE MUST, place a renewed and stronger emphasis on TECHNICAL
and LEGAL aspects of Amateur Radio than has ever been done before. We are
failing to lead the way in technology (and so is our country, behind those
that do in fact have no-code licenses now).

> experimenting and enhancement of an art/technology, that it is not
> unreasonable to require a little HISTORY or background knowledge
------- ---------- ---------

----
I do agree with on this. A few questions added to the written exams on this
subject would be very useful. We do need to learn to crawl before we can
learn to walk, but we don't need to learn to swim if we are not going near
the water.

> are not in line with the current definition of ham-radio, perhaps

> puddin'... There is no way to tell utill we try it, however, if it
> has undesireable results, it will be darn hard to undo....

An important point. It has been hashed out in many places. This is one of
the reasons my proposal limits power to 50 watts instead of the ARRL 250w.

> I agree with the 1 or 2 year expiration to the new class of license
> because when I had a 2 year CODE ONLY and ROCK-BOUND ticket, I could
> not wait to upgrade. It definitely WAS incentive to upgrade, but
----
But you wanted to upgrade to more HF privileges. The Novice class is a true
entry level class. I believe we do need to go back to a short expiration on
it. But the ARRL Communicator, and my Basic, classes are NOT entry level.
They are INTENDED to be permanent classes for people want no more privileges
than what those classes offer.

I suspect you are in the group of people who believe that ALL hams MUST
upgrade to get more HF privileges. I'm gonna bust your bubble and tell
you that there are lots of people who are NOT interested HF and working DX.

> now even Novices have VOICE on 10m. If the argument of "WHAT IF ALL
------- ---- ----- -- ---
I'm not sure this was a good idea.

> I WANT TO DO IS WORK 440mHz FM and don't want to upgrade" issue
> arises, then perhaps an AMATEUR-RADIO license is not what you want
> in the first place. They could start a whole new service apart and
> inbetween CB and the ARS, call it COMPUTER-RADIO-CITIZENS-SERVICE
> and feel free to write your own requirements for it. If the no-code
> license is at such odds with the ARS, perhaps it should be an entity
> of it's own......

This very idea is about to be proposed. It will ask the FCC to split
Amateur Radio probably at the 220 Mhz line. I can think of lots of good
arguments for the FCC to convince them to do this.

But this idea is STUPID. Why can't we have ONE SERVICE that can include
many things. Amateur Radio should not just be one kind of thing that
excludes everyone "not like us". (you see now where the elitism accusations
have come from?)

Let's have the Amateur Radio Service be one that allows many different people
with lots of diverse interest to be ONE TOGETHER despite the differences in
interests.

> TRIVIA QUESTION: If you put 1/2 the effort expended on arguing the NO-CODE
> license issue into learning CW, how fast would you be
> copying today ?????

I have spent a LOT of time arguing the NO-CODE issue, and if I had spent that
on learning code, I could probably copy 35 WPM today.

I am in fact interested in CW and do want to (re)learn code. But I have
chosen to put off my upgrade into the HF bands (which I do have an interest
in) so that I can address what I feel to be a far more important issue:

That is to make sure that Amateur Radio will survive the years to come so that
I can operate the kinds of radio operation I am interested in, by making sure
that a SENSIBLE (changed requirements, not less) expansion of the service is
done to enhance its survivability, and justification of frequency allocation,

against the rapidly growing demands from other radio services.

>or couldn't you figure that out for yourself?
>--
>Kevin Burnett, N6UWS (ex-KC6AOA) AMPR.ORG: 44.4.0.231

Just because your school requires those classes for everyone dosen't mean that all schools do. here at University of Illinois the college of engineering is exempt from the otherwise campus-wide requirement of 4 semesters of foriegn language. we ARE required to take 18 hours of humanities and social sciences that CAN include foriegn language, but the only requirement is that you have 2 sequences (same subject) of at least 6 hours each in approved humanities and social science classes.

> They give a lot more information, but not much detail. They also mention
> auctions of the frequencies. I wonder if we hams could somehow request
> some of the frequencies?? This may be something we want to watch.

No.

The reason is that in the USA, we currently have ALL the frequencies
that the ITU has allocated as Amateur, primary, secondary or otherwise.

For the FCC to allocate any frequency to the Amateur Radio Service, it
must first be allocated (at least at a secondary shared level) by the ITU.
(ignore the few countries that disregard the ITU, the USA is not one of them)

The frequencies mentioned are probably already allocated by the ITU to the
land mobile or air mobile services. The ITU makes no specification of
whether frequencies are government or non-government. The appropriate
group of federal agencies (including the FCC) can change these from government
to non-government and they are still land mobile or air mobile, and can be
used in the private sector that way with no further changes from the ITU.

The military and federal agencies will then just have fewer frequencies to
choose from, and the private sector will have more, if these changes go
through. The commercial land mobile sector stands to gain by this, and
could lessen the pressure for our frequencies (many of which are allocated
by the ITU as shared between Amateur and Land Mobile, such as 220-225, making
it easy for the FCC to hand them over to Land Mobile).

We should watch the progress carefully, and see if we can't get UPS and
others into segments of spectrum above 225 Mhz that might become available
and get our 220-222 Mhz back EXCLUSIVE.

Let's not go begging for more when the rest of the world thinks we are not
effectively using what we have now.

Source record: 17438

Don't forget that Japan only has 2 Mhz on two meters (144-146) and 10 Mhz
on 70cm (430-440 Mhz).

They do NOT have 220-225 Mhz which is allocated to TV broadcasting, which makes
it very hard for the Japanese manufacturers to test 220 equipment.

They also do NOT have 902-928 Mhz (not sure what's there) but they do have
a CB service somewhere around 900 Mhz.

For FM radio communications as we know it, we have 4+5+30 Mhz of spectrum
from which to select some frequencies for FM, but Japan has only 2+10,
which is less than a 1/3 of what we have.

Secondly, Japan has a higher population density than the United States.
The concentration of radio usage therefore is much worse in Japan.
If we had THREE TIMES the number of hams as Japan does, we'd still have less
of a problem OVERALL due to our country being spread out, and our cities not
so dense as Tokyo.

If we merely had the SAME number of hams (a million), we would have only a
third of the problems.

Let's take a look at Europe next.

I have just purchased a beautiful Measurements 80-R signal generator for which I need a schematic and manual for future maintainance and (hopefully not) repair. Anyone who has such doc, please advice, and I will, of course, pay postage and copying costs.

For those unfamiliar with this beast, it covers 5-480 MHz, has a beautiful calibrated attenuator (waveguide type) and weighs enough to make my bench bend just a little. Also has built in 400Hz and 1KHz modulation (calibrated to 30%) and inputs for pulse and AM mod as well.

Oh yes- like the famous measurements grid dip meter, it uses a 955 tube. Anyone have a source for these? our local circle could use a few for spares, replacement and hedges against an uncertain future tube market...

SpaceNews

MONDAY AUGUST 14, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* SAREX-2 NEWS *

Astronaut/Ham Ron Parise, WA4SIR is currently scheduled to carry SAREX-2 aboard Space Shuttle COLUMBIA during mission STS-35, on April 26, 1990. Ron will be operating on the 2-meter band using the same Motorola HT used by W5LFL and W0ORE during their past ham-in-space operations.

Ron's activities will include 2-way voice as well as packet radio contacts. He will use a Heath/Tasco TNC that has been modified to support a 1800 byte "meta-beacon", which will allow the crew to compose mission or SAREX scheduling messages for repeated downlink. A ROBOT mode will also be available so ground stations may connect with and receive a reply from SAREX even when the crew is not available for real-time contacts.

Frequency and scheduling information will be made available as soon those details are made available.

The orbit planned for STS-35 will have an inclination of 28.5 degrees and a mean altitude on 190 nautical miles. Mission duration will be 9 days.

* VOYAGER-2 NEWS *

Voyager photographs have confirmed the existance of "ring" bands around the planet Neptune.

Voyager will come within 3000 miles of Neptune on 24Aug89 at midnight EDT.

* OSCAR-9 NEWS *

Spacecraft controllers are keeping OSCAR-9's news bulletins as short as possible to devote more downlink time to transmitting telemetry and WOD.

Here is an actual raw telemetry frame received at KD2BD on 10Aug89 at 01:34:04 UTC on orbit 43742:

UOSAT-1 8908100013704 COMPUTER GENERATED TELEMETRY

[Inline base64-encoded payload not displayed]

* STS-28 NEWS *

Phil, KA9Q reported hearing three brief transmissions from space shuttle Columbia several minutes after lift-off on one of the Shuttle's UHF-AM voice downlink frequencies. During one of the transmissions, the words "Houston, Columbia..." were heard.

* LUNAR ECLIPSE *

A total eclipse of the moon will occur from August 16 to 17. The beginning of the umbral phase will be visible in Europe, the Middle East, Antarctica, the Atlantic Ocean, South and Central America, eastern half of North America, and the eastern half of the south Pacific Ocean. The end will be visible in West Africa, Western Europe, Antarctica, the Atlantic Ocean, South, Central and North America (except Alaska and the eastern half of the Pacific Ocean).

The moon will enter penumbra at 8:23 PM EDT (0023 UTC 17Aug). Mid-eclipse will occur at 10:08 PM EDT (0208 UTC). The moon will leave penumbra at 12:53 AM (0453 UTC). The magnitude of this eclipse will be 1.604.

Subject: "Educationally-broad" Engineers?

I *really* didn't intend to get caught up is this education debate, but I just couldn't let this one go by...

Barry Fowler writes...

>My theory is, that they concentrate on theory taught by graduate students
>because the professor is too busy to profess or to discuss anything with them.
>Their tuition is being wasted. In California, there is an excellent
>State University system and, at a reasonable cost, they provide very
>good theoretical background AND practical background. These are the
>true "broad engineers". Don't get me wrong, this isn't limited to California's
>universities. I'm just using it as an example because of familiarity.

I hope you're talking about the California State University (CSU) system, not the University of California (UC) system. I'm a proud grad of the UCLA EE program,
and my education consisted mainly of theory courses, with just a few (<5%) lab courses thrown in for good measure. Strange, though, how that 5% was the most enjoyable portion of the curriculum.

>Then, there are those who took engineering
>"because it was the thing of the future" and they read a lot of hype
>about the demand for jobs in that field and figured that they could
>make big money "doing it". A true engineer LIVES the field, they like
>to tinker and were most likely interested in the field before attending
>formal training. You know the type. They had cables strung all over their
>bedrooms when they were kids, blackened the wall sockets in their rooms :-)
>and made crude electronic gadgets before knowing the subtleties of
>electronic design.

I couldn't agree more. My classes were loaded with people who couldn't tell a inductor from a capacitor, much less know which end of a soldering iron to grab. I often wondered why those people were there. On the other hand, I blackened my share of sockets and popped a good number of circuit breakers long before I even heard the term "engineer". For another example of this,

I suggest the book "Nemesis", by Dr Richard Muller, which is the story about how he and his colleagues formulated the theory about how an asteroid impact killed off the dinosaurs. In the book, he relates a story about how he was scared to touch anything in a physics lab until one day, he dropped a $15,000 piece of equipment and smashed it. He fully expected to get chewed out (or worse) by (the late, Nobel Prize-winning) Dr Walter Alvarez, who was the project head. Instead, Dr Alvarez heartily congratulated him on his "entry into the world of real physics, where we're not afraid to break expensive equipment".

(Forgive me if I don't have this exactly right, I'm at work and the book's at home -- the gist of it is correct, though)

>The other types usually migrate to a non-technical job after becoming
>employed and tend to wear polyester and sell things :-)

Indeed! Unfortunately, those of us who "live" the field usually end up working for these guys.

RTTY DX NOTES
FOR WEEKENDING 11TH AUGUST 1989
Part 1 of 2.
BID: $RTDX1108

DID I HEAR SOME CRIES OF ANGUISH ABOUT MY COMMENTS LAST WEEK? AND DID I
HEAR SOME WORDS OF PRAISE ABOUT MY COMMENTS? YES, I DID IN BOTH INSTANCES.

GOOD, WE ARE ALL ENTITLED TO OUR OWN OPINIONS, AND PROVIDING MOST OF US
AGREE WE HAVE MADE PROGRESS, WE HOPE HAVE HELPED TO IMPROVE AMATEUR RADIO.

WHICH BRINGS ME TO THE PROPOSAL IN ITU REGION 1 FOR THE PACKET OPERATORS TO
USE A PORTION OF THE GENTLEMENS AGREED RTTY SEGMENT OF VARIOUS BANDS. SURE
WE WILL/ARE HEARING CRIES OF ANGUISH. BUT IF WE ALL OPERATE IN A
GENTLEMANLY MANNER SURELY WE CAN LIVE TOGETHER.

UNFORTUNATELY PACKET IS A SYSTEM THAT CANNOT STAND MUCH INTERFERENCE AND AS
SUCH WILL BE THE MODE WHICH WILL SUFFER MOST. MAYBE THE INTERFERENCE WILL
ASSIST THE PACKET OPERATORS TO FIND A MEANS WITHIN THEIR SYSTEM TO OVERCOME
SUCH INTERFERENCE, AND AN IMPROVED SYSTEM WILL EVENTUATE.

OUR THANKS THIS WEEK GO TO G3XTL, OD5NG, VK4RY, I5FLN, UZ9CWA, OH2LU,
G3GNR, TG9VT, W6/G0AZT AND VK2EG. THANKS CHAPS FOR YOUR EFFORTS.

>solder is, what a eutectic point is?

I, for one, know how to solder. I grudgingly admit that I don't know what
a eutectic point is, but I intend to start finding out right after this
posting.

I am a top-notch software engineer. That's how I make my living. I know
more about microprocessor interfacing techniques and RF electronics than
most of my peers.

As for educational breadth, I speak French fluently, and I write French
passably well for a French white-collar type. I have read some of the classics.
I have a talent for writing which I developed by writing science fiction.
I am one of the FEW people I know who can spell.

I can argue issues surrounding nuclear power better than an acquaintance
who has a degree in nuclear engineering. I have an active interest in
medical advances. I am teaching myself psychology.

And, by the way, I am a high school dropout. I got my education by WANTING
one. I got it out of books, and by developing my ability to get technical
whizzes to teach me what I needed to know.

I never let school get in the way of my education. When I need to know
something, I go out and learn it.

I guess the point of this is that I find it hard to blame schools for
the ignorance of their students. Motivation seemingly has everything
to do with what kind of education one gets, and curriculum seemingly
has relatively little to do with it.

>hand-helds, what is wrong with 49 MHZ?

I think you mis-quote what he said, as I see it (and what I think Brian
meant) is that if the very worst effect of a codeless license is to have a
bunch of kids plaaying "space patrol" then it is no worse than the drivel
you hear on 2M today. I agree.

Who knows, maybe the more competative space patrolers will try to improve
their equipment and end up with an industry like Sony, Icom, Kenwood or ...
(Why can't I think of an American name here?)

>I am not against kids becoming hams (I was a child ham myself). I was

2130. Re: "Educationally-broad" Engineers?

Newsgroup: rec.ham-radio
Date: 1989-08-13 21:33:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500138@ux1.cso.uiuc.edu>
Source record: 17452

We seem to now be comparing Morse Code requirements in Amateur Radio to foreign language requirements in college and university curriculums. I believe that the foreign language requirement is correct in a college environment. I also believe that it is out of place in a two-year technical school (execpt one for language translators).

I do take note that a college/university environment is a "Traditional" place to get a well rounded "liberal" education. It is sad to me that some people (in engineering) are trying to reduce the requirements when the choices do in fact exist (unlike in amateur radio where they do not).

However, we do NOT have to go to college. We are NOT forced to attend college to get good jobs. We could get an education at a technical school and get a good job. Or we can bypass higher education altogether if we want.

Ham radio today is like a traditional college education (with "liberal" requirements) but it is also the only way to get any good privileges at all. Why not have a CHOICE?

A college education is like an extra license. It is traditional, you get the best privileges, but at the expense of learning the most about so many things. It is an honor to have an extra class license.

A two-year technical school degree would be like a codeless Technician class license. You still get good privileges (just like you can get a good job) but the requirement is that you learn what your privileges/job are related to. But you don't have to learn more if you don't care to.

Having no education is like using CB.

The issue is CHOICE.

There are some people who want to deny everything to some people unless they happen to CHOOSE to do certain things a certain way. We need to allow people the choices in Amateur Radio. Then, the honor of having an extra class license will mean a bit more, because it says you CHOSE to pursue it, and were not forced or coerced into it.

2131. Antennas for Cheap Radios

Newsgroup: rec.ham-radio
Date: 1989-08-14 03:23:40 UTC
From: malcolm@Apple.COM
Message-ID: <33970@apple.Apple.COM>
Source record: 17453

I realize that this is not exactly a ham radio question but I thought some of the readers of this group might have done the necessary experimentation.

I'd like to get one of the relatively cheap FM radios for my office (digital tuner and cassette deck for $70.) Unfortunately they all use the headphone cable as the antenna and they don't provide an external antenna input.

Does anybody know the best way to couple a better antenna into this kind of radio? I've tried a long piece of wire with the end wrapped around the headphone cable but didn't get good enough results. The best results I got were a wire cut to approximately the 1/4 wavelength and held at a 45 degree angle to the vertical. Naturally if I let go of the wire the reception got worse.

What's the solution?

Malcolm Slaney

2133. FM Bandwidth of Kenwood R-5000

Newsgroup: rec.ham-radio
Date: 1989-08-14 13:49:35 UTC
From: roskos@IDA.ORG
Message-ID: <1989Aug14.134935.27336@IDA.ORG>
Source record: 17463

Does anyone know how to widen the FM bandwidth of a Kenwood R-5000 receiver? The bandwidth is currently around 12 KHz, I believe, and I want to widen it to around 30 KHz in order to receive Meteor APT pictures. The bandwidth is determined by a small black "ceramic filter" on the IF board, unlike the other modes, which have user-changeable crystal filters in large metal packages.

Is there a mail-order company that sells these filters? Or are they custom-made for specific applications? The filter has very minimal labelling on it, and is just labelled "Ceramic Filter" in the circuit diagrams, along with a code like "W455F" (unfortunately I don't have the diagrams here; I can look it up if anyone knows how to interpret these markings, but it seems to be a part number rather than a description of the filter parameters).

Someone here at work who used to work on VHF radios during WWII told me that you could widen the bandwidth of a filter by adding a resistor in parallel to the filter, but I am reluctant to try things experimentally until I get some more detail, since the IF board on the R-5000 is very fragile. I also read (in the Journal of the Environmental Satellite Amateur User's Group, JESAUG) that you could do this for some unnamed radio by replacing the filter by a small capacitor, but the author was very vague about it, and again I am reluctant to just try things experimentally without some more concrete information.

Has anyone done this before? (Or is this another of those cases where I will do it myself and then write another Usenet article on it ... :-))

Thanks for any information. -- Eric Roskos

2135. Reciprocal license for Pakistan?

Newsgroup: rec.ham-radio
Date: 1989-08-14 15:26:00 UTC
From: Blake.Ward@NATASHA.MACH.CS.CMU.EDU
Message-ID: <619111616.bdw@NATASHA.MACH.CS.CMU.EDU>
Source record: 17456

Next spring I will be leading an expedition to climb Broad Peak in Pakistan. Since the members of the expedition either have licenses or will (hopefully) be getting them before then, we would like to use our 2m handhelds for communications on the mountain. Unfortunately, according to the latest information that the ARRL has, Pakistan does not have any reciprocal agreement with the U.S. or license foreign amateur radio operators.

I'm hoping that maybe someone on this mailing list will have first hand information. Has anyone out there operated in Pakistan or tried to get a reciprocal license? I don't suppose there are any visiting hams from Pakistan reading this mail list? Any help or suggestions would be much appreciated.

Blake Ward (KA3PLZ)

Not THE Rohde of Rohde and Schwarz. Ulrich Rohde is the *son* of
the founder of Rohde and Schwarz. He never even worked there.
Also, I wouldn't take any of Ulrich Rohde writings as gospel.
He has a history of writing articles with just enough information
to make you want to hire him as a consultant, but not enough
information to actually build the circuit being described. He
reminds me of the principle that "a half-truth is more dangerous
than a lie."

2137. Re: Crossed-Field Antennas

>
> --
> Jeff Miller, WD6CQV/KH6 | "Just because I'm a Californian,

Thanks Jeff for getting this notes string off of trivial like no-code and
pizza.

There is a classic paper in the IRE/IEEE proceedings (it
might have been written by Wheeler), that gives a relationship
between antenna Q (hence bandwidth), efficiency, and occupied
volume (defined as the smallest sphere that could contain the
antenna). It was similar in concept to Shannon's theorem of
communication in that Shannon put an upper bound on channel
capacity without regard to details of implementation. Similarly,
the paper I am thinking of puts a depressingly small upper bound
on the ratio of efficiency to Q for *any* antenna that is
as small as the crossed-field antenna. Hence, if such a small
antenna were to have good efficiency, it would have to have a very
high Q. A high Q would not only mean very narrow bandwidth,
but would result in extremely high voltages and currents. This
in turn puts a limit on the amount of transmitter power that
can be used before the breakdown voltage of air is reached.
This is similar to the guys who put a "bugcatcher" 80M coil
on their mobile whip and run a KW mobile. Now that the coil
losses are reduced, they find that they have a serious corona
problem at the end of the whip.

The only contribution the crossed-field antenna might make
would be that its copper losses are considerably lower than
other small antennas. Then it would at least allow you to
make the tradeoff of getting good efficiency and very little
bandwidth. A lot of small antennas are such that they make
this tradeoff for you with losses and limit your efficiency
to a small percentage.

Anyone have one (or more) of these little gems? I just ordered one of the IC-2SATs from Hamtronics in PA - they said they had them in stock and I should have mine by Wednesday.

I would be interested in anyone's experience(s) with them even though it's probably too late to cancel the order. Conversely, I will try to post an article about it when I get mine and have had a chance to play around with it.

p.../ hprmokg:rec.ham-radio / john@stiatl.UUCP (John DeArmond) / 5:38 pm Aug 10, 1989 /
p...In article <4399@portia.Stanford.EDU; paulf@Jessica.Stanford.EDU (Paul Flaherty)
writes:
p...;
p...;Tom Peters (of "In Search of Excellence" fame and from the Stanford B-school)
p...;recently wrote an excellent column extolling the virtues of requiring more
p...;breadth in engineering education (or rather decrying the lack of). .....
p...; ...
p...;I've heard a number of excuses for all of this; "Students should do that on
p...;their own", and "we don't have the time" are two of my favorite fantasies.
p...;Maybe it's time to add a fifth year to the engineering curriculum.
p...;
p...;Of course, I'm only addressing one direction of breadth; it would be nice
p...;if we could add business, law, and psychology courses in as well, but as it
p...;is, engineering is still one of the most demanding courses of study.
p...;
p...;I couldn't agree more, Bob.
p...
p...I'd second Paul's comments. Perhaps this is perhaps a bit far afield from
p...ham radio, but then again, mayby not. Education is a reason we tend
p...to banter about with relative impunity when justifying our service.
p...
p...My experience in running a small high technology company (about 25 people)
p...has been that the productivity and ease of management is generally inversely
p...proportional to the number of years they spent in a university environment.
p...Even in the rather esoteric (sp) field of nuclear engineering, the people with
p...a good trade school or BS degree were VASTLY more valuable to me than those
p...with (sometimes) many PhD's. Of course, I kept one or 2 around just to
p...run out on the masthead but that's a different story.
p...
p...My experience with applied engineering education is that the system has
p...failed miserably. And we've gone through a generation of non-education
p...so that now it's questionable whether the schools COULD teach even
p...given a chance. I suppose we can blame this beginning in the '60s
p...when the universities became centers for socal activism instead centers
p...for higher education.
p...
p...And even those engineers that learn a bit of theory learn practically nothing
p...of the practical world. I remember visiting a graduate electrical
p...engineering class a few years ago and marveled as I watched 2 PhD candidates
p...try to solder a component to a circuit board without solder. When I
p...inquired, they told me they thought one simply melted the lead with iron!
p...

p...Even as I look around my present environment, I see that some of the
p...best programmers and programming managers are non-degreed (myself included -
p...I have an engineering apprenticeship certificate). It does make one
p...wonder when most people remember the parties they attended much better
p...than they remember any class.
p...
p...Paul, I don't think we need another year added to engineering school.
p...I think people like Phil K. are geniuses DESPITE higher education.

This is an interesting thought, I, like Einstein, (not making any other
comparisons) had to go and do it a second time (get my degree).
It took a couple of years of work as an engineer (wo dgree) so that
I could go back and finish school. It seems to me IMHO that being
told that I didn't do it RIGHT, etc in school the first time almost
ruined me. The second time it was easy, I used the same approach only this
time I came equipped with articles from EDN (etc) and help from
some of my fellow engineers to understand THEIR way. The RIGHT way had
nothing to do with it, if the educators could actually open their eyes
and understanding. Inovation and great ideas come from doing things
differently (right or wrong), but being allowed to experiment and being
graded on all fronts. I know a few fellow workers who wear velcro (TM)
shoes 'cause they can't tied shoe laces (see what I mean about invention).
....
p...I used to run around with a person like phil. We both laid out of class
p...practically our whole junior and senior year in high school. The
p...difference was I earned Bs and Cs while he made straight As and aced
p...the SAT. And we had a GOOD school, one of the tops in the nation.
p...I think profound changes will be necessary. I can certainly testify
p...as to the effectiveness of the engineering apprentice system. This is
p...certainly food for thought and discussion.
p...
p...
p...--
p...John De Armond, WD4OQC | Manual? ... What manual ?!?
p...Sales Technologies, Inc. Atlanta, GA | This is Unix, My son, You
p......!gatech!stiatl!john **I am the NRA** | just GOTTA Know!!!
p...----------

....
This is where amateur radio is a reflection of the idealism's of
what we learn in school. We have been arguing and discuss and
disecting reasons for code, nocode, pizza etc in a classic rag chew
type environment.
Aren't we allowed to dream. Aren't we allowed to have change, to make
mistakes, to try or are we going to talk it to death (fillibuster sp?).
What happened to some discussions about how to improve your shack. OR
a replacement to AX.25 which will incorporate some of the latest
technology. I for one would like to see more useful discussions on the
net :-). After all in our everyday work life, don't we use some of those
cute sayings like "possecesion is 9/10 of the law". I've seem quite a few
of them thar inginurs manage to build quite a domain using this technique...

IMHO I have a theory about no-code. The code may not be the problem,
itself. You have to understand that one has to know how to SPELL to be
able to do CW. How many of your co-ops can SPELL (most of mine couldn't :-)).
Maybe we haven't approached this discuss from the cause, but from the effect!!

How can we allow our future to graduate with being able to communicate
their ideas, or to type. (i'll leave that one as an execise for the
reader, [I'll execpt email if it's too tough])...

I recently received these letters from one of my Congressmen and thought they would be of interest to the net.

UNITED STATES SENATE
WASHINGTON, DC 20510

June 13, 1989

Dear Friend:

Recently the American Radio Relay League (ARRL), on behalf of amateur radio operators such as yourself, brought to my attention problems associated with the reallocation of the 220-222 MHz radio frequency band. The concerns of the ARRL were based on the Federal Communication Commission (FCC) decision to reallocate the 220-222 MHZ band on an exclusive basis to the land mobile radio service.

Last year Congress passed legislation that required government agencies to take into account "the valuable contributions made by amateur radio operators when considering actions affecting the Amateur Radio Service." In light of this statute and in response to the amateur radio operators' interest in this matter, I informed the FCC Chairman and Commissioners of my strong support for your association's request for reconsideration of the allocation of the 220-222 MHz band. I hope my letter to the FCC (copy enclosed) will help.

I am impressed by and thankful for the significant contributions of the amateur radio operators in our nation and in the State of Michigan. Amateur radio operators represent the true American volunteer spirit, and I applaud the more than 14,000 radio amateurs whose volunteer efforts have assisted the State of Michigan in emergency and disaster relief situations, including the crash in 1987 at Detroit Metropolitan Airport.

I congratulate you and all amateur radio operators on the outstanding service that you provide to Michigan and the nation.

Sincerely,

Carl Levin

UNITED STATES SENATE

COMMITTEE ON
GOVERNMENTAL AFFAIRS

WASHINGTON, DC 20510-6250

May 25, 1989

Mr. Dennis R. Patrick, Chairman
Federal Communications Commission
1919 M Street, N.W., Room 814
Washington, DC 20056

Dear Chairman Patrick:

I strongly support the request of the American Radio Relay League (ARRL), on behalf of the more than 450,000 amateur radio operators, for reconsideration by the FCC of the reallocation of the 220-222 MHz radio frequency band.

The amateur radio operators represent the true American volunteer spirit. In Michigan alone we have more than 14,000 radio amateurs whose volunteer efforts have assisted the State of Michigan in emergency and disaster relief situations including the 1987 Detroit Metropolitan Airport disaster.

Last year Congress adopted P.L. 100-594, which requires government agencies to take into account "the valuable contributions made by amateur radio operators when considering actions affecting the Amateur Radio Service." The reallocation of the 220-222 MHz band has the potential to displace and impair the service of the amateur radio operators and, therefore, disserve the 1988 legislation.

I urge the Commission to carefully review the concerns of the amateur radio operators over the proposed displacement of their access to the 220-222 MHz band, and to carefully consider all available alternatives when reconsidering this matter. It is particularly ironic that while the President is looking to expand our volunteer sector, the action of the Commission could hurt one of our vital volunteer resources.

Thank you for carefully considering the ARRL concerns and looking into a compromise that will be acceptable to the various interests involved.

Sincerely,

Carl Levin, Chairman
Subcommittee on Oversight of Government Management

Cross-posted to: rec.ham-radio,sci.electronics

I obtained a copy of ORBIT23.EXE from SIMTEL. I have been quite happy with it, however, I have been able to make a number of improvements to the program that I would like to share. However, I want to see how you feel about re-distributing the "modified" version of it and/or find out if you perhaps would like to test drive it first.

To cover the hightlights, the changes include online help, friendlier user interface, multiple beacon support (and description). The major improvements include the ability to ^C out at any time (not just when displaying to screen) and when capturing report to file, the report is echoed to the screen also. This eliminates the "wait for the completed report" or the "run it twice" syndrome (on a slooooww 8088, this is a big deal).

The program now generates multiple reports (without going back to dos) and permits previewing of satellite keplerian data without report generation. It now also sports "other file" capability for keplerian data.

Will,
I have a Sony 2010. The "growling" is due to the station being
tuned in off frequency. My synchronous detector will "lock on" +/- 1KHZ
with a strong signal, +/- 0.2KHZ with weak signals. Sometimes selective
fading will cause the sync to "unlock" and growl for a few seconds if I
am not exactly (to the 0.1KHZ) tuned to the station.

Not all shortwave stations broadcast on exactly the freqency they claim.
Compounding this, the frequency synthesizer appears to be slightly
low when I compare it to WWV (2.5, 5, 10, 15, and 20 MHZ) transmissions.
When my ICF-2010 says 10,000.0 it really is 9,999.7MHZ. So if I want to
avoid the growling, I must be sure to tune very carefully. The sideband
indicator will change from usb to lsb when tuning across the center of
the station. Be sure to set the tuning rate to fine (0.1KHZ rate).

2145. 1989 ARRL 10 GHz Cumulative Contest

Newsgroup: rec.ham-radio
Date: 1989-08-14 21:10:10 UTC
From: wjc@XN.LL.MIT.EDU
Message-ID: <8908142110.AA25881@XN.LL.MIT.EDU>
Source record: 17379

I tried posting this via Usenet to just New England, but I think that didn't work.

I am wondering if anyone else in New England is planning to operate the 10 GHz contest which begins this weekend (Aug 19-20 & Sep 16-17).

I expect to spend the first weekend on the Green Building at MIT in Cambridge, MA. The location is N 42 21' 37'' W 71 05' 23''. The height is about 96 meters ASL. I will be using either my call, N1CPK, or the W1XM club call (probably the latter).

So far, the only other person whom I know who plans to be operating is Dale AF1T. He expects to be on Mt. Kearsarge in New Hampshire (N 43 22' 26'' W 71 51' 54' 895 meters ASL).

I do not yet have any narrowband equipment. I have a single 30-mW Gunnplexer with a 2-foot dish. The rig can be used in "either direction" on the standard 10.250/10.280 GHz pair.

AF1T has Gunnplexer equipment and I believe also narrowband gear.

Message-ID: <8908142324.AA07631@ti.com>
Source record: 17380

(I usually hate messages like this, but here goes...)

I'm considering purchasing a PRO-2005 scanner. I'm aware of
mods to give it full 800mHz but does anyone have a mod that
allows you to hook up a BFO to it. Otherwise it will be
"somewhat" difficult to hear SSB with it.

By the way, I just talked to Grove Enterprises. They will send
you the 800MHz Mods (and perhaps others) if you send them a
Self Addresses Stamped Envelope and $2.00. They also sell
the PRO-2005 for $30 less than Radio Shack (and no sales tax).

No I don't work for Grove (But I'm considering giving them some of
my money). Their address is

Grove Enterprises
PO Box 98
140 Dog Branch Road (Really!!)

I know the FCC has stated this, but it has not be explicitly put into the
regulations until the new rule reorganization (which included some minor
changes to "fill in holes").

(in regards to JA infant(dels) on two meters)

Is this illegal in Japan, or is this legit operation
if this is illegal, what is being done about it
(US has severe fines and possible jail for offenders
not to mention confiscation of equipment, is this true
in Japan)

Thanks for the example. Your quest, should you choose to
accept it, is to get info from a culturally similar, legal system
"similar" country with code-free licenses, and see if they report
problems of this sort. Cultural differences mean alot *ALOT*
for an example of an extreme nature look at Japanese game shows.
(well maybe not that different, but good ol' US of A hasn't got a
chance in terms of 'crazy` commercial vidio programming.) Any
correlation? I'm not a social sci type. Thanks again for the
ONE example.

>posting.
>

60/40 solder does not have one! 63/37 solder does. As the amount
of lead and the amount of tin is varied the melting point lowers
and the range of temperatures at which your soldering alloy is mush
narrows until you have a eutectic mixture which has a clean transition
from solid to liquid. Proceeding past this point yields a alloy which
will once again exhibit a pasty phase. Eutectic alloys are useful to
help eliminate the infamous 'cold' solder joint (only one of the
causes of which is motion of the parts during the pasty phase) and to
reduce the soldering temp. (although there are bismuth and antimony
alloys that are better at this)

BTW does anyone know if a solder alloy with copper can be made with a
eutectic point (the stuff I have has 3% copper and is mush for quite
a while). (btw copper is added to stop erosion of copper soldering
tips for you no-iron folks)

49mHz is fine for play, but if the desire is to increase the number
of young, knowledgable operators, why would you reduce the incentive
by restricting the usage of hard-earned privileges?

>...the example of Japan, where a code free VHF license has made
>2 mtrs practically unusable, according to JA ham friends.

the question is, what constitutes use? much of the traffic here
on 2M is social, and some of it is play. adults and children play
differently. perhaps you would argue that children who learned
5 wpm cw would play more compatibly than those who didn't. no-code
could argue that children who were required to learn more relevant
things than code might also play compatibly, and additionally be
more useful by virtue of the relevance of their knowledge.

>

Though good for audio in/out, unfortunately most of these CODEC parts mangle the incoming/outgoing audio data, and in some cases, actual *bandpass* (instead of the more correct *low pass*) the incoming audio; this works great for your average human voice, but may prove limiting in more advanced (and interesting) applications.

> Another thing that I want to try is feeding the audio
> from one of my radios into the SPARCstation 1 and transmit a packet beacon.
> I then want to re-transmit the saved beacon without the use of a TNC, and see
> if I can receive it.

If SunOS was sufficiently "real-time", you could easily generate the audio data yourself (via a program), and feed it to the driver for transmission. In short, you could easily implement some modems via this chip (though you really need to know more about the characteristics of the anti-aliasing and reconstruction filters in the hardware). Note, however, that when UNIX starts getting busy and your system starts swapping, don't expect things to happen in a timely manner... :)

As an alternative, a simple board with a GP DSP chip (the Motorola 56001 comes to mind) and some A/D, D/A, etc. parts, you can easily do a lot of slick, real-time amateur-radio related processing in an IBM PC/clone (which is dirt-cheap these days). One of the possibilities with such a board that I see as being exciting is the implementation of modems that take into account the poor transfer characteristics of the tranmsission medium (e.g. your 2M radio, an HF path, etc.). Adaptive modems can really help in getting data through a poor link that is otherwise unusable. There are other interesting opportunities in simple audio filtering, image processing, voice mail, and the like. One of these drop-in boards could be your one-stop solution to all your communication needs. :)

Oh, and you can expect to see just such an inexpensive drop-in board for the PC in the very near future...

AO-13 MODE S BEACON FIXED

HR AMSAT NEWS SERVICE BULLETIN 224.01 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 12, 1989
TO ALL RADIO AMATEURS BT

AO-13 Mode S Beacon Can Now Be Commanded Off During Normal Mode S Operations

AMSAT ground-command station operator Peter Guelzow (DB2OS) reported this week that with the help of DF5DP and ON6UG he was able to make a major break through in improving the performance of the Mode S transponder aboard AO-13. One of the original problems which plagued Mode S users was the fact that the Mode S beacon would not shut off as it was designed to do so during normal transponder operations. Consequently, it was necessary to use exorbitant amounts of power on 70cm to put a bring a copyable signal down in the 2400 MHz passband. In short, Mode S users had to "compete" with the beacon for RF output power. Among the many "eyeball" QSOs that Peter had at DATASPACE '89 at the University of Surrey two weeks ago, G2BFO and ON6UG make it known to Peter the curious behaviour they had noticed recently everytime the Mode S transponder was automatically switched on. They observed that there seemed to be a slight delay sometimes when the transponder came on -- sometimes the transponder would switch on, then the beacon would turn off, and then the beacon would come back on a moment later and visa-versa. So after returning from DATASPACE '89, Peter decided to investigate this report further. With the help of DF5DP and ON6UG providing him with instantaneous feedback using terrestrial packet links, Peter then sent several combinations of commands to AO-13 and was able to "manually" command the Mode S beacon off during normal Mode S transponder operation. This was the first time this had ever happened and with the beacon turned off, signal reports were excellent. Moreover, Peter says that he can now change the software to make this process happen automatically. At this time it is not possible to say with any certainty how much power it will take on 70cm to get into Mode S transponder with the beacon off; but the "best" guess is that it will require less power. After next week's busy transponder schedule change and attitude re-adjustment on AO-13, Peter will begin work on changing the ground-command software. Peter adds that he feels that something must have "changed" in the hardware since he first did tests a year ago on the Mode S transponder. Look for further updates on this important bulletin next week from the AMSAT News Service

(ANS).

SB ALL @ AMSAT $ANS-224.02
AO-13 TRANSPONDER SCHED CHANGE

HR AMSAT NEWS SERVICE BULLETIN 224.02 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 12, 1989
TO ALL RADIO AMATEURS BT

AO-13 Transponder Schedule Change Planned For August 16, 1989

According to VK5AGR, AMSAT ground-command station, there will be a AO-13 transponder schedule change effective August 16, 1989. This change in schedule marks the end of "full-time" transponder operation. AO-13 will now start to encounter solar eclipse periods lasting from 3 minutes to 27 minutes between MA 247 through perigee to MA 001. This means that the all transponder operations will have to cease during this perigee time. Also, AO-13 will be making an attitude re-adjustment from the current Bahn coordinates of BLONG=180/BLAT=0 to BLONG=210/BLAT=0. The actual start of the this attitude maneuver will be on August 14th. All users should take note that magnetorquing will occur during the perigee passes of Orbits 893/894/895/896 from MA 224 to MA 31. Further magnetorquing may be required to "fine-tune" the attitude and if this is necessary, it will be done during August 16-20th. AO-13 users who have the G3RUH PSK 400 baud demodulator are encouraged to observe the telemetry on AO-13 during these eclipse periods. Particularly interesting are spacecraft temperatures during eclipse. Telemetry "watchers" will be suprised at how rapidly the temperatures drop. The following is the schedule for AO-13 until November 16th:

AO-13 Transponder Schedule
16Aug89 until 16Nov89
BLON/BLAT 210/0

Mode B: MA 003 to MA 160
Mode JL: MA 160 to MA 200
Mode B: MA 200 to MA 240
Off: MA 240 to MA 003
Mode S: MA 210 to MA 222

SILVER SPRING, MD AUGUST 12, 1989
TO ALL RADIO AMATEURS BT

AMSAT Short Bursts

Through the efforts of Sumio Nakane (JH3BJN), AMSAT-NA has received the following operating schedule for FUJI-OSCAR-12 for the next few months:

DATE MODE OPERATING PERIOD

08/16/89 JA 02:40 UTC until 10:52 UTC
08/19/89 JA 02:00 UTC until 10:12 UTC
08/25/89 JD 00:39 UTC until 08:51 UTC
08/27/89 JD 00:53 UTC until 09:04 UTC
09/02/89 JA 22:37 UTC until 06:49 UTC on 09/03/89
09/05/89 JA 21:57 UTC until 06:00 UTC on 09/06/89
09/08/89 JD 19:15 UTC until 03:27 UTC on 09/09/89
09/13/89 JA 18:48 UTC until 03:00 UTC on 09/14/89

PLEASE NOTE: NO FO-12 OPERATION FROM SEPT. 15TH
TO SEPT. 25TH DUE TO SOLAR ECLIPSES!

09/26/89 JA 15:12 UTC until 23:24 UTC
09/30/89 JD 21:50 UTC until 12:44 UTC on 10/01/89
10/06/89 JD 20:29 UTC until 11:23 UTC on 10/07/89
10/10/89 JA 10:42 UTC until 18:54 UTC

There is a AMSAT 17M Net which is convened every Sunday evening beginning at 23:00 UTC on a frequency of 18.155 MHz. Acting as Net Control Stations (NCS) are KO5I and N4QQ. This net provides another opportunity for those who cannot listen to the AMSAT nets on Sunday afternoon to still find out what is happening in the world of amateur radio satellites. So join KO5I and N4QQ on Sunday evenings for this new AMSAT HF net.

de DB2OS 01May89: *** AO-10 TRANSPONDER SCHEDULE ***
14Jul89 to 01Sep89

Mode-B : from MA 000 to MA 255

AMSAT-NA is soliciting papers for presentation at and/or publication in the proceedings of its 1989 Space Symposium. Areas of interest include research, development, engineering, funding, construction, management and operation of OSCAR (Orbiting Satellite Carrying Amateur Radio) communications and scientific spacecraft and associated communications networks. Submissions or questions should be forwarded to: Ralph Wallio, W0RPK, CITS Chairman-AMSAT'89, 1250 Highway G24, Indianola, IA 50125. Or you can reach Ralph at the following "land-line" numbers: Home:(515) 961-6406 or Office: (515) 224-8034. On packet-radio you can send him messages via packet BBS W0AK. Also, if you would like to receive a "information" packet about the AMSAT-NA Space Symposium to be held on November 3-6th of this year in Des Moines, IA, please send Ralph a s.a.s.e. with one unit of postage.

WB6LLO suggest that those wishing to experiment with packet on AO-13 should look for him using PSK on the following frequencies:

Mode B-145.870 down, approx. 435.530 up

Mode J-435.950 down, approx. 144.460 up

WB6LLO mentions that if you are having difficulty "connecting" with him that you can meet him up 10 KHz for a voice contact, that is, on Mode B at 145.880 MHz or on Mode J at 435.960 MHz

/EX

If you have an HF SSB receiver, you can use the scanner as a
tuneable converter for the SSB receiver.

To listen to SSB signals on a PRO-2004/5, I would
connect the antenna jack of my SSB HF receiver to the output
of my scanner's last IF amplifier. A DC blocking capacitor and
a short length of shielded cable is a must.

> I've read that some receiver has a synchronous AM detection mode.
> Leconte Thierry

The April, 1982 issue of Popular Electronics has a construction article
on a 455kHz add-on synchronous detector:

Build a Synchronous Detector for AM Radio
Dave Hershberger, W9GR
p 61-71

It detects DSB, SSB (USB or LSB), switches to an envelope detector while
tuning and whenever the signal is not usable for synchronous detection.

In the January, 1984 issue of Radio-Electronics is an article about
C-QUAM that describes the Motorola chip MC13020P which has a block
diagram similar to the one shown in the PE article which makes me
suspect that it might be used to make a synchronous detector.
York David Anthony has posted articles on C-QUAM and may be able to
shed some light on the use of this chip for sync detector purposes.

Build this C-QUAM AM stereo Converter
Marty Bergan
p 41-46,102,114

Another chip for sync detection is the Plessey SL624C Multimode detector.
Plessey chips are not listed in most of my catalogs.

One thing I always suggest to ANY students in college is to work in Your field ON CAMPUS (if you can). I learned more being involved with an R&D project than I did in class... That may not be entirely true, but I had to learn a lot of things on the project Before I saw them in class...

It was also kinda a pain, it made what could have been interesting classes a little boring... hi hi

Another thing (not meaning to beat the dead horse) is that how can we get the Engineering schools Not treat Humanities like some people treat CW?

I admit that those courses did have some value, but the way they were presented I didn't see much value in them at the time... but then again I fall into the catagory of - don't force me to memorize useless dates, Give me the text and ask some MEANINGFUL questions, not stuff like "When did so-and-so sneeze..."

All levels of education need work...

>brush, a battery and some electrolyte/metal solutions. I'll look around and
>see if I can locate one of the ads. I do recall a review in one of the
>shooting magazines that said the kit was pretty much as advertised.

JNT Mfg Co Inc of Stormville, NY 12582 makes these metal plating kits.
The kit uses a battery powered brush which is dipped in the non-cyanide
silver solution and painted on the metal to be plated. They supply
solutions to plate many common metals but it may require several steps.

I have seen these kits advertised many places over the years: Jenson Tools,
US General Supply, etc. The only current supplier I know is
Edmund Scientific. They sell the kits and refil solutions. The kits are:

silver $34.95
24k gold $69.95
chromelike $29.95
rhodium $99.95
copper $24.00
gloss black $34.95

From JNT's brochure I think that you can order directly from them also.

After the plating operation, wash the surface with soap and lots of
water to remove the chemical residue. Several years ago, my repeater
group home-brewed a set of duplexer cavities, using 4" copper pipes,
silver-plated inside with Cool Amp (tm). A year later, the cavities'
performance degraded. We found an awful-looking green fungus of
corrosion inside.

Does anyone know what chemicals _Cool Amp_ contains, and the best way
to neutralize them?

>
> An operator license callsign of the 1x2 variety (e.g. K1IO)
> only indicates a minimum proficiency of 13 WPM, unless it
> is a N#xx callsign.

Not to pick nits, Trey, but while you're technically correct, a 1x2 callsign only indicates 13 WPM proficiency IF it was issued prior to WWII, or under obscure circumstances that I can't think of. All postwar 1x2 assignments were made to Extras only, either randomly (1960s program) or by choice (mid-70s program, where I got mine from). Not a lot of "old-time" 1x2s are left, and some have Extras (I think it was a minimum Advanced, but maybe some Generals have 'em) and I don't know of any on this network!

BTW, I'm the original holder of k1io, since they never got that far in the olden days. I don't know if K#xx was used domestically pre-war (when K calls were overseas, such as K4 for current KP4 and K6 for Hawaii) but District 1 was never very big.

>on the IF board, unlike the other modes, which have user-changeable
>crystal filters in large metal packages.

While I don't know the Kenwood R-5000, it sounds rather like the common
ceramic filters that are in lots of other radios. Murata is one
well-known manufacturer. Way back in the early 1970s, I had a "Drake
TR-22" (actuallly made by Kenwood) which had a Murata filter at 455 kHz.
The last letter of the filter was its seletivity code. A "D" filter was
about 16 kHz wide, not that the slopes were all that steep. That was
in mine, but later ones (TR22C) had the tigher E and or F filters, which
were barely wide enough for voice FM (12 kHz or so), thus just right
for 2 meters.

I think a "B" filter would be around 25 or 30 kHz, but then I never had
one. My handy DigiKey catalog doesn't list NBFM filters, but somebody
must carry them.
>Is there a mail-order company that sells these filters? Or are they

>until I get some more detail, since the IF board on the R-5000 is very

No, don't try it! Old WWII radios used "IF cans", which were LC
circuits inductively coupled (resonant transformers). Resistors would
lower the Q and make them broader. Ceramic filters are different, and
you'd not get predictable results. Probably just lower gain out of the
radio.

Go for a wider filter of the same type. They're probablay made.

2160. Re: Re: FT757 RF feedback problems.

Newsgroup: rec.ham-radio
Date: 1989-08-15 16:13:38 UTC
From: brian@hpmtlx.HP.COM
Message-ID: <1850001@hpmtlx.HP.COM>
Source record: 17475

I had an FT-757. Just upgraded to an FT-767. I haven't had any feedback problems with either one, but you may be interested in another problem that sounds like it may be part of your problem. I had an AEA PK-232 hooked up to my 757 via the rear panel jacks. It caused hum every time I operated SSB. I opened up the PK-232 and found 2 problems: 1) The screw in the left rear (as seen from the front) that is supposed to connect the PC board ground to the chassis was a painted screw and the connection was not good, and 2) The terminating resistors that are located near the rear connectors for the audio output circuits have too long of a ground return. Just remove the resistors and presto! No more hum! The resistors are not really necessary here. You could also lift them off the board and connect the ground to a point closer to the output chip (which is near the front panel). GL

This is late as it took FOUR weeks for our netnews `guru' to believe and
then fix the fact that we weren't getting mail onto the network.

AMEN, Halleluah, and pass the plate for my donation! Seriously, I don't
know what most of us space cadets would do without Henry. AMSAT is
currently building four spacecraft (called Microsat) for launch on the
Ariane 40 that will take up SPOT-2 (and first launch of the 40 configuration)
along with two UOSAT's (University of Surrey in Guildford, Surrey, England,
run by G3RUH, Martin Sweeting and LONGTIME AMSAT community member (see
recent New Scientist article on them). It has been a pleasure to spend
most of the 100 hours that Henry mentions are available on AMSAT's projects
and though there are times I want to throw up my (prima donna) hands in
disgust and walk away, it is a rewarding experience that is like no other
than going out there yourself! This fall I will be standing next to the
Ariane 4 placing the fruits of many fine peoples labors (including mine)
for our 14-th, 15-th,16-th,17-th,18-th, and 19-th satellites in the OSCAR
series on board. Between three UOSAT's and two Microsat's DOVE and WEBERSAT,

(in orbit or about to be)

there will be five satellites dedicated to education. So you don't need to be
an amateur radio operator to use our birds in the listen mode. Three
CCD camera satellite, three digital data /voice satellites, and other neat
experiments. You don't need to be a radio amateur to participate in our
projects. OSCAR 13 was built in Colorado with significant help from local
L-5 members. One of these fellow space cadets is now an engineer for
Interferometrics, Inc. working on AMROC's birds (I^2 is doing the avionics
and payload integration and I^2 has a commercial marketing agreement for
Microsat) as a DIRECT result of his AMSAT experience. There are three
folks who came into aerospace work THROUGH AMSAT and now are project

leaders on several projects for OSC and Pegasus.
For your information, we signed a memorandum of understanding with the World Space Foundation (WSF) to explore handling their command, control, and telemetry on the Solar Sail project. We are exploring the possibility of building our first Clarke orbit bird as a replacement for the ATS-3 services for island peoples and others in the Pacific basin, and we need you. SSI, located here in Princeton (I have been too busy to drop by, sorry) wants us to consider involvment in LPO and other stuff. We are definitely in demand and having fun! The space cadet leaders will be too busy until November to spend any quality time talking to the interested because of integration and thermal-vac and launch campaigns for Microsat, but after that COME ON BY. Our annual meeting (it moves around) this year is in Des Moines, Iowa in November. Give us a shout if you want to drop by or give a paper, etc.

AMSAT, P.O. BOX 27, Washington, D.C. 20044

2164. FT-767 Program for IBM

Newsgroup: rec.ham-radio
Date: 1989-08-15 17:07:40 UTC
From: brian@hpmtlx.HP.COM
Message-ID: <1850002@hpmtlx.HP.COM>
Source record: 17377

I have written a program for the IBM PC that gives the FT-767GX unlimited memories, accessible either numerically or via 'keywords'. For example, if you have entered WWV (at, say 10 MHZ) into the data file as memory 1038, with keywords of WWV10 and 10M, you enter either 1038 or WWV10 or 10M. The local repeater could be accessed either as memory #2 or lra or Loveland, etc. The program sets up VFO A on one freq and VFO B on the other and selects SPLIT if needed. It's pretty neat. Requires the RS-232 adapter and COM1. You create your own data file according to a strict format. Anybody interested?

Play is also learning. All the "trivial" radio activity helps sharpen our radio operating skills (with particular radios) ever so much more. Gee, we might learn little trivial things like how long our batteries REALLY last when we do lots of transmitting at high power. We might learn how holding the HT sideways affects the range. We might learn just when far away repeaters are usable.

If the kids get a no-code ham radio license, and then want to go play "space invaders" on a simplex channel, then fine. That one will more likely know how to operate a radio, to switch between VFO and memory modes, to tune the new fangled synthesizers, IN AN EMERGENCY when most people would panic and forget everything not heavily practiced.

The same applies to the "old fart" who is talking about his last stay in the hospital. He too will still know what to do IN AN EMERGENCY.

Let's not belittle what appears to be "trivial" use of the radio frequencies.

>said they had them in stock and I should have mine by Wednesday.
>I would be interested in anyone's experience(s) with them even though it's
>probably too late to cancel the order...

i saw the ic2s at hro a couple weekends ago. it's a real small radio,
just a little too large for a key fob. i'm not sure where they
put the touch-tone pad for the 2sat version.

the radio seemed to have every feature the yaesu ft411 offers, save
one memory and pl decode. however, a glance through the manual
indicates that purchasing the pl decode option also buys some sort
of tone-sequence paging, which seems interesting. it also has a
clock, and the audio may be a little better.

the main drawback of this radio is that you must control the many
features using only a half dozen buttons (including the ptt). i
don't know whether getting the tt pad will make it easier to use
(eg, the ic2gat uses the keypad only for generating touch-tones),
but you will definitely have the smallest ht on the block!

Strange. I would say that maybe there's something wrong with your receiver. I've noticed the growl *occasionally*, but I often listen to broadcasters for hours on end without running into the problem.

I don't know what you could do to fix it. Personally, I've never had this problem occur with timed tapings, either. Then again, I haven't done any timed DXing to speak of, just program taping (until I get that stereo tape deck so I can have WWV on the other channel from my 2001....)

My 1987 Callbook shows K5BI as a General, and N5AG as an Advanced (!).
No, I don't know how they got them. I was looking for a pair of brothers
I used to know about that held consecutive 1x2s, but one with a W5
prefix and one with a K5 prefix, but I didn't find them. I suspect that
the K-prefixed non-Extras were assigned the calls long ago when you
could keep the same suffix when moving from one call are to another. I
cannot explain N5AG, though, except possibly as a Callbook error.

Herewith some interesting info to add to the eternal "HTs-on-aircraft"
discussion; evidence of actual RF interference with an airliner operation.
This was in the RISKS Digest.
Regards, Will

Subject: Cellular Telephone Causes Airliner Fire Alarm

A morning radio news report here in Washington, DC reported that a commercial
airline crew noted a fire alarm signal from a cargo hold in mid-flight. Upon
returning to their originating airport, the cargo hold was examined carefully,
and no evidence of fire was found. Apparently, a cellular telephone in a
passenger's luggage had received an incoming call, that activated the smoke (I
assume) detector via RF interference.

This occurrence shows why we have systems engineers. That is, someone who must
consider not only electromagnetic compatibility between system components, but
also with other systems in the same operating environment. As a result of this
event, the aircraft companies may have to redesign a lot of sensors.

2173. Sony 2010 query

Newsgroup: rec.ham-radio

I couldn't stand it - with all the nice comments about the Sony 2010 receiver on this net, and since 95% of my time on the ham bands was spent listening - I bought one. Wow! By the way, Grove sez they're out of stock on them until "late September"; I bought one locally, for $31 over Grove's price. Neat rig! By the way, to a recent poster here whose 2010 was slightly off frequency: I tune in WWV at exactly 10.0000 MHz.
I'm fascinated by the synchronous detection mode for AM signals, and I have a question. For really strong signals with no nearby interference, using synch makes no noticeable difference. In other cases, where the desired signal is slightly weaker and/or with nearby interference or fading, synch makes a WORLD of difference! Fantastic! But there are actually a few cases where using synch hurt reception. If I happen to be band scanning in AM mode, and come across an AM signal, in rare cases the use of synch has caused the audio of the station to disappear. In those cases, going to sideband reception in an attempt to zero-beat the carrier led to a situation where I coulnd't find the carrier. Was I listening to an image, or to splatter? Or, are there DSB transmissions out there with either suppressed or reduced carrier, for which use of synchronous detection is inappropriate?

All this discussion on EE's that can't solder spell etc. is good but
in a bid to move on to better things I would like to pose the following
challenge:

I frequently travel to many countries and would like to stay in touch with home
I would like the simplest design for a S.W. receiver that could receive one
frequency under lets say 10 Mhz.

I know that there are many one chip receivers on the market, I would like the
simplest circuit that would offer acceptable performance in a simple design that
will eliminate hassles with custom officials in third world countries.

Come on guys pizza?!, there are many news groups out there that handle mundane
discussions, lets get back to practical amateur radio.

STAR::CULVER "Cant Buy Me Love" 227 lines 13-AUG-1989 18:27

Well here I am in vain glorious New Hampshire.

And I've got noticeable TH7 problems. I wanted to hear from
other readers out there with TH7s (I know I know they all
work rain or shine and are 1:1 all the way across the bands.)
This isn't a story of a girl and her beam, think of it as
an epic novelette of love, war, and intense loathing in
the northern part of our country.

Some background, my previous antenna was a TH5 on up 60
feet on a Rohn freestander. It worked flawlessly. And I
loved it. There were trees near the TH-5.

When I moved up here I got a new 80 foot Rohn SSV (one has
to be prepared for ice storms ya know.) It sits on a pad
with all three legs individually grounded and tied together
with #4 cable whichs runs 40' into the house to the rig. This is
bonded to the house electrical and cold water grounds.

Enter stage stage right a new-in-the-box TH-7. The TH-7 was
assembled with appropriate reverence, all the the traps were
put on correctly, measurements were checked and double checked
by no less than three hams. The joint slots were pointed down
along with the trap holes. I'm going to go to much detail
because we've been through a lot of trouble.

It was installed rather easily with minimal trauma. Feeding the beam
is a seven foot RG-213 service loop. The service loop connects to new
LDF-450 1/2" semi-rigid ("hardline") cable which descends for 62 feet
to the 18 foot level where it goes into polyphaser gas discharge
lightening protection. From the polyphasers LDF-450 continues for 55
feet into the house. Here silver plated teflon pl-259s and RG-213
connect to the rig. All of the connectors are new Andrew connectors
of the correct gender eliminating barrels.

When we connected the TH7 to find ... LA STINKA SWR ! I was more
than a little surprised after a dream-like experience with the TH-5.
Now the hassles started. We immediately started tower climbing
to inspect connections which were ok. Its very hard to mess up
an Andrew connector as, if you get it on, its usually on right.

It was very late Sunday night like around two A.M. My dog Bliss
and I climbed woefully into bed to toss and turn fitfully. I was
going to be in poor shape the next day.

The next day my friend Kevin KA2EYP called HY-GAIN and asks to speak to an engineer in search of words of wisdom. We ran an SWR sweep of the bands for the 14th time, but this time we wrote the points down. HY_GAIN was going to ask for them I knew. He got a salesman instead. He couldn't talk to engineers he was told. The salesman did listen to the grim statistics and whistled when he heard them, "Yup they're high".

Kevin: "What's wrong "?
HG: "Obviously your coax is bad."
Kevin: "Its brand new.
HG: "Cant be our antenna, not if you put it together right."

Later that afternoon my phone rings and Kevin relays the response to me.

Kevin: "Any ideas ?"
Me: "We're going to build a TDR. Better get the May QST out and read the article.

To keep a long story shorter, the TDR worked and worked well. We looked at all the antennas and dummy loads we could find knowing their properties before we looked at the TH-7. NW1U's G5RV looked like a bow in an apron. What an impedance mess. We were pretty comfortable with the new technology made with a high-quality function generator and a scope.

The feedline looks fine. We could see the smallest perturbations in the line.

"Lets see.... there's the 60 foot run and there's the polyphaser and the 'run up the tower. And theres the BN-86."

Feedline looked ok. But just to make sure, I ran the RG-8 from a working 75 meter up a fed the beam. Same thing. We put a dummy load up at the antenna and saw 1:1. These were very good indications that the feedline was ok.

We didn't stop at the feedline coming into the house. I examined SWR contributions from every interconnecting cable going to the 940. There are several. Of particular interest was the fact that the Alpha added about 1/2 point of SWR. I spent a night tearing into the alpha, to find that I wasn't crazy about the T/R scheme. By a little different placement of the wires I got the SWR down to where it was only adding .4 of a point of SWR.

During the remainder of the week - HYGAIN had me running up and down the tower running numerous insipid and inconsequential little tests. The balun was good, the feeder was good. To a human the tower grounding looked good, even remembering that RF doesn't look at things the ways ohmeters do.

By mid week the next week after no less than twenty trips up the tower Kevin called.

"They want us to take a bolt off the antenna."

"Where is the bolt"?

"The 10 meter director".

Internally I gasped, "Thats more than 60 inches out on the boom."

"Thats what they want us to do."

That night I was up the tower, hanging off with a wrench on a stick. turning that damned bolt 20 degrees per wrench twist. The mosquitos were having a feast and I began to think about photography as a past time.

Looking back on it, now I remember that this was August 2nd. My mothers birthday. And where was her daughter? Hanging off a tower, feeding mosquitos in New Hampshire while twisting a wrench on a stick uttering profanities. I forgot to call Mom. She still isn't speaking to me.

The next day, HY_GAIN threw their hands up and told us to ship the antenna back to them. They would out of the kindness of their hearts either send me a new one at no charge at some undefined later date or send me one right now if I would give them my credit card number.

Kevin called to tell me this new event. I gave him a credit card number and it was ordered.

That night I was on the tower, gently lowering the antenna to the ground so it could be shipped back.

Nagging thoughts bothered me. I looked at HYGAINS published specs comparing the TH5 and TH7. Hmmmm. The TH5 definitely had better SWR curves. These thoughts nagged me more and more. Soooo I called NM3U in my hometown and said:

"I gotta have a number for for a TH7 owner."
"NR3Y"
"thanks bye."

We have that kind of relationship.

11:00 P.M. August 4th. NR3Y got a phone call. He'd never swept his beam before but now was as good a time as any.

When he was finished I was sick. His SWR curves were identical to mine. 2.5 to 1 on the bottom of fifteen is nothing to laugh at.

The next day Kevin found a bad trap on the beam. It had a broken mounting tab on the capacitive sleeve. The trap would telescope in free space, and it was a fifteen meter trap.

The next day the new beam got there. and Kevin started on it. He was recuperating from major surgery, could not work and could do the light work for the beam. He started thursday afternoon and we were finished by saturday at noon. I check and double checked the dimensions.

We had made one mod in HYGAINS dimensions. If you'll noticed the TH7 "resonates" around 29.25 and up high in all the phone bands. We added an inch to everything, that is to say one inch to all elements, on each side of the boom. Now it was checked and complete. Instantly a ground crew appeared and I went up the tower for the twentieth time. The new TH7 went up well. When I got down, we all congratulated ourselves and knew the SWR would at least meet HY-GAINS published worst case curves.

WRONG RENEE

They were very similar. AT this point I didn't even bother to call. HY-Gain. I started my own test regimen. KA2DEW scrambled up the tower with a Bird and measured the SWR up there. One of the things we had noticed earlier was that the transmitter would see very different ratios if the feedline length was varied. So we wanted to see if changing the length effected things up there. GOOD. It didn't.

Kevin asked me what I thought our 29th set of curves meant.

"It means that we can pick a convenient length of coax that looks good to the transmitter and everyone will be happy. The concept of feeder not changing the impedance a transmitter sees is only true if its terminated into a matched non-reactive load. We're seeing all of the craziness we've been seeing because this antenna is probably presenting a very complex impedance to the feedline."

And thats what it meant. The Antenna has performed very well. It has good gain, good F/B ratios, good S/S ratios and I've been very happy until today.

At seven A.M. this morning Kevin was awakened by my shrieks.

It started raining yesterday and the SWR shot right up. It hasn't stopped so I don't want any climbing a tower in the rain. Everyone else seems to be hearing bands well. I get the impression that I'm not. Its pattern seems far less sharp.

Kevin and I have checked all the connections they're sealed well, and the TDR ? It seems ever so happy with what its seeing. The element extensions did help, My TH7 no longer resonates in the OSCAR band.

"What are you going to do with the TH7 ?", he asked.

"Well kev I'm not predisposed to violence but I'd like to cut it down to a two meter beam with a high powered rifle."

Kevin blinked.

"Or I'd like to get it off the tower with out ropes".

Actually I'd like to talk to a KLM salesman.

What Id really like to do is hear from other people who have had experience with a dual driven element beam.

Whats it like when it rains at your house. Does your beam turn
into a dummy load ? Im serious in asking this. I'm so tired
of this.

Its going to be a long winter, I can tell.

73s 88s and 33s

[Lots of neat stuff about solder eutectic points omitted.]

> BTW does anyone know if a solder alloy with copper can be made with a
> eutectic point (the stuff I have has 3% copper and is mush for quite
> a while). (btw copper is added to stop erosion of copper soldering

Hmmm. The AWS-ASTM specifications on solders usually have an upper
limit of 0.08% copper---copper tends to raise the melting point of
the solder. However, there are copper BRAZING filler metals that
fit the bill:

AWS-ASTM #	Eut. Pt. Temp	Composition
BCu-1	1980 F	>90% copper
BCu-1a		
Bcu-1b		
BAg-8a	1410 F	71-73% silver, balance mostly copper
BAu-2	1635 F	80% gold, balance mostly copper

Soldering temperatures are in the neighborhood of 350-600F,
for reference---brazing temperatures are HOT.

> tips for you no-iron folks)
>
> /Tjp
> -disclaimer (I claim to *know* the answer, chem e's do (or should))

Actually, this is more in the line of materials science---it's been
about 10 years since I my last course in THAT subject. I've since
followed the advice to ``The Graduate'', going into plastics...

From: christiansen%chera1.decnet@CHEWI.CHE.WISC.EDU
Message-ID: <8908170705.AA29246@ucbvax.Berkeley.EDU>
Source record: 17397

One more lead on the eutectic solder. It turns out that a binary
mixture of 99.25% Tin and 0.75% Copper has a eutectic point of
227C versus the 183C eutectic point for 63% Tin 37% Lead solder.
I don't know if anyone makes a commercial solder with this
composition--it wasn't on my ancient list of standard solders.

And after he considered the letter in his hand very carefully, he turned slightly, leaned over a bit, and wiped his ass with it.

Sorry, I couldn't resist. After the way he (they) responded to the Petitions for Reconsideration and the other protests (such as Levin's letter), I can't help but think that's exactly what he did with ALL of the anti-reallocation papers which were filed in this matter.

Oh well. We'll keep trying.
